# Supplementary Material for: Entropy Partial Transport with Tree Metrics: Theory and Practice 

Tam Le* RIKEN AIP

Truyen Nguyen*<br>The University of Akron

This is the supplementary material for the main text in [11]. We organize it as follows:

- We give detailed proofs of the theoretical results in the main text for the entropy partial transport (EPT) problem for nonnegative measures on a tree having different masses in 8
- We provide further experimental results in $\S(\mathbb{B}$, e.g.,
- about more setups for the efficient approximation of $\widetilde{\mathrm{ET}}_{\lambda}^{0}$ for $\widetilde{\mathrm{ET}}_{\lambda}^{\alpha}$,
- about different values of $\alpha$,
- about different numbers of slices,
- and about different parameters in tree metric sampling.
- We next give more details and discussions in \$C e.g.,
- more details about experiments (e.g., softwares, datasets, more details about the experiment setup).
- some brief review about kernels, and more referred details (e.g., for tree metric sampling, persistence diagrams and related mathematical definitions in topological data analysis).
- more discussions about other relations with other work.

We note that we have released code for our proposals at

> https://github.com/lttam/EntropyPartialTransport.

## A Detailed Proofs

In this section, we present detailed proofs of the theoretical results in the main text.

[^0]Supplementary Material for: Entropy Partial Transport with Tree Metrics: Theory and Practice

## A. 1 Proof for Theorem 3.1 in the main text

Proof. i) Note that $\mathrm{ET}_{c, \lambda}(\mu, \nu)$ is a concave function in $\lambda$ since it is the infimum of a family of concave functions in $\lambda$. Therefore, $u$ is convex on $\mathbb{R}$. In particular, $u$ is differentiable almost everywhere on $\mathbb{R}$.

Let $\lambda \in \mathbb{R}$, recall the definition of $\mathcal{C}_{\lambda}(\gamma)$ in Equation (4) in the main text. Then for any $\gamma \in \Gamma^{0}(\lambda)$, we have

$$
\begin{equation*}
\operatorname{ET}_{c, \lambda+\delta}(\mu, \nu) \leq \mathcal{C}_{\lambda+\delta}(\gamma)=\mathcal{C}_{\lambda}(\gamma)-b \delta \gamma(\mathcal{T} \times \mathcal{T})=\operatorname{ET}_{c, \lambda}(\mu, \nu)-b \delta \gamma(\mathcal{T} \times \mathcal{T}) \forall \delta \in \mathbb{R} \tag{1}
\end{equation*}
$$

This implies that

$$
\left\{b \gamma(\mathcal{T} \times \mathcal{T}): \gamma \in \Gamma^{0}(\lambda)\right\} \subset \partial u(\lambda)
$$

We next show that the opposite inclusion is also true, i.e., $\left\{b \gamma(\mathcal{T} \times \mathcal{T}): \gamma \in \Gamma^{0}(\lambda)\right\}=\partial u(\lambda)$. This is obviously holds if $\partial u(\lambda)$ is singleton and hence we only need to consider $\lambda$ for which the convex set $\partial u(\lambda)$ has more than one element.

Let $m \in \partial u(\lambda)$, then $m$ can be expressed as a convex combination of extreme points $m_{1}, \ldots, m_{N}$ of $\partial u(\lambda)$, i.e., $m=\sum_{i=1}^{N} t_{i} m_{i}$ with $0 \leq t_{i} \leq 1$ and $\sum_{i=1}^{N} t_{i}=1$. As $m_{i}$ is an extreme point of $\partial u(\lambda)$, there exists a sequence $\lambda_{n} \rightarrow \lambda$ such that $\lambda_{n}$ is a differentiable point of $u$ and $u^{\prime}\left(\lambda_{n}\right) \rightarrow m_{i}$.
Let $\gamma^{n} \in \Gamma^{0}\left(\lambda_{n}\right)$, then $b \gamma^{n}(\mathcal{T} \times \mathcal{T})=u^{\prime}\left(\lambda_{n}\right) \rightarrow m_{i}$. By compactness, there exists a subsequence $\left\{\gamma^{n_{k}}\right\}$ and $\tilde{\gamma}^{i} \in \Pi_{\leq}(\mu, \nu)$ such that $\gamma^{n_{k}} \rightarrow \tilde{\gamma}^{i}$ weakly. It follows that $\gamma^{n_{k}}(\mathcal{T} \times \mathcal{T}) \rightarrow \tilde{\gamma}^{i}(\mathcal{T} \times \mathcal{T})$, and hence we must have $b \tilde{\gamma}^{i}(\mathcal{T} \times \mathcal{T})=m_{i}$. We have

$$
\begin{aligned}
\mathcal{C}_{\lambda_{n_{k}}}\left(\gamma^{\lambda_{n_{k}}}\right)=\mathcal{C}_{\lambda}\left(\gamma^{\lambda_{n_{k}}}\right)+b\left(\lambda-\lambda_{n_{k}}\right) \gamma^{n_{k}}(\mathcal{T} \times \mathcal{T}) & \geq \operatorname{ET}_{c, \lambda}(\mu, \nu)+b\left(\lambda-\lambda_{n_{k}}\right) \gamma^{n_{k}}(\mathcal{T} \times \mathcal{T}) \\
& \geq \operatorname{ET}_{c, \lambda}(\mu, \nu)-b \bar{m}\left|\lambda-\lambda_{n_{k}}\right|
\end{aligned}
$$

and for any $\gamma \in \Gamma^{0}(\lambda)$, there holds

$$
\mathcal{C}_{\lambda_{n_{k}}}\left(\gamma^{\lambda_{n_{k}}}\right) \leq \mathcal{C}_{\lambda_{n_{k}}}(\gamma)=\mathcal{C}_{\lambda}(\gamma)+b\left(\lambda-\lambda_{n_{k}}\right) \gamma(\mathcal{T} \times \mathcal{T})=\operatorname{ET}_{c, \lambda}(\mu, \nu)+b\left(\lambda-\lambda_{n_{k}}\right) \gamma(\mathcal{T} \times \mathcal{T})
$$

We thus deduce that $\lim _{k \rightarrow \infty} \mathcal{C}_{\lambda_{n_{k}}}\left(\gamma^{\lambda_{n_{k}}}\right)=\operatorname{ET}_{c, \lambda}(\mu, \nu)$. These together with the lower semicontinuity of $\mathcal{C}_{\lambda}$ give

$$
\begin{aligned}
\operatorname{ET}_{c, \lambda}(\mu, \nu)=\liminf _{k \rightarrow \infty} \mathcal{C}_{\lambda_{n_{k}}}\left(\gamma^{\lambda_{n_{k}}}\right) & =\liminf _{k \rightarrow \infty}\left[\mathcal{C}_{\lambda}\left(\gamma^{\lambda_{n_{k}}}\right)+b\left(\lambda-\lambda_{n_{k}}\right) \gamma^{n_{k}}(\mathcal{T} \times \mathcal{T})\right] \\
& =\liminf _{k \rightarrow \infty} \mathcal{C}_{\lambda}\left(\gamma^{\lambda_{n_{k}}}\right) \geq \mathcal{C}_{\lambda}\left(\tilde{\gamma}^{i}\right)
\end{aligned}
$$

Therefore, $\tilde{\gamma}^{i} \in \Gamma^{0}(\lambda)$ with mass $b \tilde{\gamma}^{i}(\mathcal{T} \times \mathcal{T})=m_{i}$. Due to the convexity of $\Gamma^{0}(\lambda)$, we have $\bar{\gamma}:=\sum_{i=1}^{N} t_{i} \tilde{\gamma}^{i} \in \Gamma^{0}(\lambda)$ with $b \bar{\gamma}(\mathcal{T} \times \mathcal{T})=\sum_{i=1}^{N} t_{i} m_{i}=m$. That is,

$$
\partial u(\lambda) \subset\left\{b \gamma(\mathcal{T} \times \mathcal{T}): \gamma \in \Gamma^{0}(\lambda)\right\}
$$

and we thus infer that $\left\{b \gamma(\mathcal{T} \times \mathcal{T}): \gamma \in \Gamma^{0}(\lambda)\right\}=\partial u(\lambda)$ for all $\lambda \in \mathbb{R}$.
In order to prove the second part of i), let $\gamma \in \Gamma^{0}\left(\lambda_{1}\right)$ and $\tilde{\gamma} \in \Gamma^{0}\left(\lambda_{2}\right)$ be arbitrary. We have

$$
\begin{align*}
\operatorname{ET}_{c, \lambda_{2}}(\mu, \nu)=\mathcal{C}_{\lambda_{2}}(\tilde{\gamma}) & =\mathcal{C}_{\lambda_{1}}(\tilde{\gamma})-b\left(\lambda_{2}-\lambda_{1}\right) \tilde{\gamma}(\mathcal{T} \times \mathcal{T}) \\
& \geq \operatorname{ET}_{c, \lambda_{1}}(\mu, \nu)-b\left(\lambda_{2}-\lambda_{1}\right) \tilde{\gamma}(\mathcal{T} \times \mathcal{T}) \tag{2}
\end{align*}
$$

Hence by combining with (1), we deduce that

$$
\operatorname{ET}_{c, \lambda_{1}}(\mu, \nu)-b\left(\lambda_{2}-\lambda_{1}\right) \tilde{\gamma}(\mathcal{T} \times \mathcal{T}) \leq \operatorname{ET}_{c, \lambda_{2}}(\mu, \nu) \leq \operatorname{ET}_{c, \lambda_{1}}(\mu, \nu)-b\left(\lambda_{2}-\lambda_{1}\right) \gamma(\mathcal{T} \times \mathcal{T})
$$

which yields $\gamma(\mathcal{T} \times \mathcal{T}) \leq \tilde{\gamma}(\mathcal{T} \times \mathcal{T})$. This together with the above characterization of $\partial u(\lambda)$ implies the second part of i).
ii) If $u$ is differentiable at $\lambda$, then $\partial u(\lambda)$ is a singleton set. However, as $\partial u(\lambda)=\left\{b \gamma(\mathcal{T} \times \mathcal{T}): \gamma \in \Gamma^{0}(\lambda)\right\}$ by i), we thus infer that the mass $\gamma(\mathcal{T} \times \mathcal{T})$ must be the same for every $\gamma \in \Gamma^{0}(\lambda)$.
Next assume that every element in $\Gamma^{0}(\lambda)$ has the same mass, say $m$. For $\delta \neq 0$, let $\gamma^{\lambda+\delta} \in \Gamma^{0}(\lambda+\delta)$ and $m(\lambda+\delta):=\gamma^{\lambda+\delta}(\mathcal{T} \times \mathcal{T})$. Then, we claim that

$$
\begin{equation*}
\lim _{\delta \rightarrow 0} m(\lambda+\delta)=m \tag{3}
\end{equation*}
$$

Assume the claim for the moment, and let $\delta>0$. Then, as in (1)-(2), we have

$$
\operatorname{ET}_{c, \lambda+\delta}(\mu, \nu) \leq \operatorname{ET}_{c, \lambda}(\mu, \nu)-b \delta m \quad \text { and } \quad \operatorname{ET}_{c, \lambda+\delta}(\mu, \nu) \geq \operatorname{ET}_{c, \lambda}(\mu, \nu)-b \delta m(\lambda+\delta)
$$

It follows that

$$
-b m(\lambda+\delta) \leq \frac{\operatorname{ET}_{c, \lambda+\delta}(\mu, \nu)-\operatorname{ET}_{c, \lambda}(\mu, \nu)}{\delta} \leq-b m
$$

This together with claim (3) gives $\lim _{\delta \rightarrow 0^{+}} \frac{\mathrm{ET}_{c, \lambda+\delta}(\mu, \nu)-\mathrm{ET}_{c, \lambda}(\mu, \nu)}{\delta}=-b m$. By the same argument, we also have $\lim _{\delta \rightarrow 0^{-}} \frac{\mathrm{ET}_{c, \lambda+\delta}(\mu, \nu)-\mathrm{ET}_{c, \lambda}(\mu, \nu)}{\delta}=-b m$. Thus, we infer that $u$ is differentiable at $\lambda$ with $u^{\prime}(\lambda)=b m$. Therefore, it remains to prove claim (3).
Indeed, by compactness there exists a subsequence, still labeled by $\gamma^{\lambda+\delta}$, and $\gamma \in \Pi_{\leq}(\mu, \nu)$ such that $\gamma^{\lambda+\delta} \rightarrow \gamma$ weakly as $\delta \rightarrow 0$. As in i), we can show that $\gamma \in \Gamma^{0}(\lambda)$. Then, as the mass functional is weakly continuous, we obtain $m(\lambda+\delta)=\gamma^{\lambda+\delta}(\mathcal{T} \times \mathcal{T}) \rightarrow \gamma(\mathcal{T} \times \mathcal{T})=m$. We in fact have shown that any subsequence of $\{m(\lambda+\delta)\}_{\delta}$ has a further subsequence converging to the same number $m$. Therefore, the full sequence $\{m(\lambda+\delta)\}_{\delta}$ must converge to $m$, and hence (3) is proved.
iii) For any $\lambda \in \mathbb{R}$, we have $\partial u(\lambda)=\left\{b \gamma(\mathcal{T} \times \mathcal{T}): \gamma \in \Gamma^{0}(\lambda)\right\} \subset[0, b \bar{m}]$. Thus, we only need to prove $[0, b \bar{m}] \subset \partial u(\mathbb{R})$. First, note that as $\partial u(\lambda) \subset \mathbb{R}$ is a compact and convex set, it must be a finite and closed interval. Therefore, if we let

$$
\gamma_{\min }^{\lambda}:=\underset{\gamma \in \Gamma^{0}(\lambda)}{\arg \min } \gamma(\mathcal{T} \times \mathcal{T}) \quad \text { and } \quad \gamma_{\max }^{\lambda}:=\underset{\gamma \in \Gamma^{0}(\lambda)}{\arg \max } \gamma(\mathcal{T} \times \mathcal{T})
$$

then it follows from ii) that $\partial u(\lambda)=\left[b \gamma_{\text {min }}^{\lambda}(\mathcal{T} \times \mathcal{T}), b \gamma_{\text {max }}^{\lambda}(\mathcal{T} \times \mathcal{T})\right]$ for every $\lambda \in \mathbb{R}$. From Equation (4) in the main text, it is clear that $\partial u(\lambda)=\{0\}$ for $\lambda$ negative enough. Indeed, if we take $\lambda<-M$, then as $w_{1}(x)+w_{2}(y) \leq b c(x, y)+M$, we have $0<b c(x, y)-w_{1}(x)-w_{2}(y)-\lambda$ for all $x, y \in \mathcal{T}$. Then, we obtain from Equation (4) in the main text that $\mathcal{C}_{\lambda}(0) \leq \mathcal{C}_{\lambda}(\gamma)$ for every $\gamma \in \Pi_{\leq}(\mu, \nu)$ and the strict inequality holds if $\gamma \neq 0$. Thus, $\Gamma^{0}(\lambda)=\{0\}$ which gives $\partial u(\lambda)=\{0\}$ and $u(\lambda)=-\int_{\mathcal{T}} w_{1} \mu(d x)-\int_{\mathcal{T}} w_{2} \nu(d x)$.
We next show that $\partial u(\lambda)=\{b \bar{m}\}$ for $\lambda$ positive enough. Since $c(x, y)$ is bounded due to its continuity on $\mathcal{T} \times \mathcal{T}$, we can choose $\lambda \in \mathbb{R}$ such that $c(x, y)-\lambda<0$ for all $x, y \in \mathcal{T}$. Let $\gamma \in \Gamma^{0}(\lambda)$. We claim that either $\gamma_{1}=\mu$ or $\gamma_{2}=\nu$. Indeed, since otherwise we have $\gamma_{1}\left(A_{0}\right)<\mu\left(A_{0}\right)$ and $\gamma_{2}\left(B_{0}\right)<\nu\left(B_{0}\right)$ for some Borel sets $A_{0}, B_{0} \subset \mathcal{T}$. Let $\tilde{\gamma}:=\gamma+\left[\left(\mu-\gamma_{1}\right) \chi_{A_{0}}\right] \otimes\left[\left(\nu-\gamma_{2}\right) \chi_{B_{0}}\right]$. Then, for any Borel set $A \subset \mathcal{T}$ we have

$$
\begin{aligned}
\tilde{\gamma}_{1}(A)=\gamma_{1}(A)+\mu\left(A \cap A_{0}\right)-\gamma_{1}\left(A \cap A_{0}\right) & =\gamma_{1}\left(A \backslash A_{0}\right)+\mu\left(A \cap A_{0}\right) \\
& \leq \mu\left(A \backslash A_{0}\right)+\mu\left(A \cap A_{0}\right)=\mu(A)
\end{aligned}
$$

Likewise, $\tilde{\gamma}_{2}(B) \leq \nu(B)$ for any Borel set $B \subset \mathcal{T}$. Thus $\tilde{\gamma} \in \Pi_{\leq}(\mu, \nu)$. On the other hand, it is clear from Equation (4) in the main text and the facts $\gamma_{1} \leq \tilde{\gamma}_{1}, \gamma_{2} \leq \tilde{\gamma}_{2}$, and $c-\bar{\lambda}<0$ that $\mathcal{C}_{\lambda}(\tilde{\gamma})<\mathcal{C}_{\lambda}(\gamma)$. This is impossible and so the claim is proved. That is, either $\gamma_{1}=\mu$ or $\gamma_{2}=\nu$. It follows that $\gamma(\mathcal{T} \times \mathcal{T})=\bar{m}$ for every $\gamma \in \Gamma^{0}(\lambda)$, and hence $\partial u(\lambda)=\{b \bar{m}\}$. This also means that $u$ is differentiable at $\lambda$ with $u^{\prime}(\lambda)=b \bar{m}$.
Therefore, it remains to show that

$$
\begin{equation*}
(0, b \bar{m}) \subset \partial u(\mathbb{R})=\bigcup_{\lambda \in \mathbb{R}}\left[b \gamma_{\min }^{\lambda}(\mathcal{T} \times \mathcal{T}), b \gamma_{\max }^{\lambda}(\mathcal{T} \times \mathcal{T})\right] \tag{4}
\end{equation*}
$$

Assume by contradiction that there exists $m \in(0, b \bar{m})$ such that $m \notin \partial u(\lambda)$ for every $\lambda \in \mathbb{R}$. For convenience, we adopt the following notation: for sets $A, B \subset \mathbb{R}$ and $r \in \mathbb{R}$, we write $A<r$ if $a<r$ for every $a \in A$, and $A<B$ if $a<b$ for every $a \in A$ and $b \in B$. Let us consider the following two sets

$$
S_{1}:=\{\lambda: \partial u(\lambda)<m\} \quad \text { and } \quad S_{2}:=\{\lambda: \partial u(\lambda)>m\}
$$

Then $\lambda \in S_{1}$ if $\lambda$ is negative enough, and $\lambda \in S_{2}$ if $\lambda$ is positive enough. For any $\lambda_{1} \in S_{1}$ and $\lambda_{2} \in S_{2}$, we have $\partial u\left(\lambda_{1}\right)<m<\partial u\left(\lambda_{2}\right)$, and hence $\lambda_{1}<\lambda_{2}$ by the monotonicity in i). That is, $S_{1}<S_{2}$ and so we obtain

$$
\lambda^{*}:=\sup \left\{\lambda: \lambda \in S_{1}\right\} \leq \inf \left\{\lambda: \lambda \in S_{2}\right\}=: \lambda^{* *}
$$

If $\lambda^{*}<\lambda^{* *}$, then for any $\lambda \in\left(\lambda^{*}, \lambda^{* *}\right)$ we have $\lambda \notin S_{1}$ and $\lambda \notin S_{2}$. Therefore, $\partial u(\lambda) \nless m$ and $\partial u(\lambda) \ngtr m$. Hence, we can find $m_{1}, m_{2} \in \partial u(\lambda)$ such that $m_{1} \geq m$ and $m_{2} \leq m$. Thus, $m \in\left[m_{2}, m_{1}\right] \subset \partial u(\lambda)$ due to the convexity of the set $\partial u(\lambda)$. This contradicts our hypothesis, and we conclude that $\lambda^{*}=\lambda^{* *}$.

We next select sequences $\left\{\lambda_{n}^{1}\right\} \subset S_{1}$ and $\left\{\lambda_{n}^{2}\right\} \subset S_{2}$ such that $\lambda_{n}^{1} \rightarrow \lambda^{*}$ and $\lambda_{n}^{2} \rightarrow \lambda^{* *}=\lambda^{*}$. For each $n$, let

$$
\gamma_{\text {min }}^{n}:=\underset{\gamma \in \Gamma^{0}\left(\lambda_{n}^{1}\right)}{\arg \min } \gamma(\mathcal{T} \times \mathcal{T}) \quad \text { and } \quad \gamma_{\max }^{n}:=\underset{\gamma \in \Gamma^{0}\left(\lambda_{n}^{2}\right)}{\arg \max } \gamma(\mathcal{T} \times \mathcal{T})
$$

By compactness, there exist subsequences, still labeled as $\left\{\gamma_{\min }^{n}\right\}$ and $\left\{\gamma_{\max }^{n}\right\}$, and $\gamma^{*}, \gamma^{* *} \in \Pi_{\leq}(\mu, \nu)$ such that $\gamma_{\min }^{n} \rightarrow \gamma^{*}$ weakly and $\gamma_{\max }^{n} \rightarrow \gamma^{* *}$ weakly. By arguing exactly as in i), we then obtain $\gamma^{*}, \gamma^{* *} \in \Gamma^{0}\left(\lambda^{*}\right)$, $\gamma_{\text {min }}^{n}(\mathcal{T} \times \mathcal{T}) \rightarrow \gamma^{*}(\mathcal{T} \times \mathcal{T})$, and $\gamma_{\max }^{n}(\mathcal{T} \times \mathcal{T}) \rightarrow \gamma^{* *}(\mathcal{T} \times \mathcal{T})$. As $b \gamma_{\min }^{n}(\mathcal{T} \times \mathcal{T})<m$ due to $\lambda_{n}^{1} \in S_{1}$, we must have $b \gamma^{*}(\mathcal{T} \times \mathcal{T}) \leq m$. Likewise, we have $b \gamma^{* *}(\mathcal{T} \times \mathcal{T}) \geq m$ as $b \gamma_{\max }^{n}(\mathcal{T} \times \mathcal{T})>m$ for all $n$. Hence, $m \in\left[b \gamma^{*}(\mathcal{T} \times \mathcal{T}), b \gamma^{* *}(\mathcal{T} \times \mathcal{T})\right]$. Since $\gamma^{*}, \gamma^{* *} \in \Gamma^{0}\left(\lambda^{*}\right)$, we infer that $m \in \partial u\left(\lambda^{*}\right)$. This is a contradiction and the proof is complete. We note that since $\lambda_{n}^{1} \leq \lambda^{*} \leq \lambda_{n}^{2}$, we have from the monotonicity in i) that

$$
\gamma_{\min }^{n}(\mathcal{T} \times \mathcal{T}) \leq \gamma(\mathcal{T} \times \mathcal{T}) \leq \gamma_{\max }^{n}(\mathcal{T} \times \mathcal{T})
$$

for every $\gamma \in \Gamma^{0}\left(\lambda^{*}\right)$. By sending $n$ to infinity, it follows that $\gamma^{*}(\mathcal{T} \times \mathcal{T}) \leq \gamma(\mathcal{T} \times \mathcal{T}) \leq \gamma^{* *}(\mathcal{T} \times \mathcal{T})$ for every $\gamma \in \Gamma^{0}\left(\lambda^{*}\right)$. That is, $\gamma^{*}=\gamma_{\text {min }}^{\lambda^{*}}$ and $\gamma^{* *}=\gamma_{\text {max }}^{\lambda^{*}}$.

## A. 2 Proof for Lemma 3.2 in the main text

Proof. We first observe for any Borel set $A \subset \mathcal{T}$ that

$$
\hat{\gamma}(A \times\{\hat{s}\})=\hat{\gamma}(A \times \hat{\mathcal{T}})-\hat{\gamma}(A \times \mathcal{T})=\hat{\mu}(A)-\gamma(A \times \mathcal{T})=\mu(A)-\gamma_{1}(A)=\int_{A}\left(1-f_{1}\right) \mu(d x)
$$

For the same reason, we have $\hat{\gamma}(\{\hat{s}\} \times B)=\int_{B}\left(1-f_{2}\right) \nu(d x)$ for any set Borel set $B \subset \mathcal{T}$. Also,

$$
\begin{aligned}
\hat{\gamma}(\{\hat{s}\} \times\{\hat{s}\}) & =\hat{\gamma}(\hat{\mathcal{T}} \times\{\hat{s}\})-\hat{\gamma}(\mathcal{T} \times\{\hat{s}\}) \\
& =\hat{\gamma}(\hat{\mathcal{T}} \times \hat{\mathcal{T}})-\hat{\gamma}(\hat{\mathcal{T}} \times \mathcal{T})-[\hat{\gamma}(\mathcal{T} \times \hat{\mathcal{T}})-\hat{\gamma}(\mathcal{T} \times \mathcal{T})] \\
& =\hat{\mu}(\hat{\mathcal{T}})-\hat{\nu}(\mathcal{T})-\hat{\mu}(\mathcal{T})+\gamma(\mathcal{T} \times \mathcal{T})=\gamma(\mathcal{T} \times \mathcal{T})
\end{aligned}
$$

Since the Equation (6) in the main text is obviously true for sets of the form $A \times B$ with $A, B \subset \mathcal{T}$ being Borel sets, we only need to verify it for sets of the following forms: $(A \cup\{\hat{s}\}) \times B, A \times(B \cup\{\hat{s}\}),(A \cup\{\hat{s}\}) \times(B \cup\{\hat{s}\})$ for Borel sets $A, B \subset \mathcal{T}$. We check it case by case as follows.

Case 1: Using the above observation, we have

$$
\hat{\gamma}((A \cup\{\hat{s}\}) \times B)=\hat{\gamma}(A \times B)+\hat{\gamma}(\{\hat{s}\} \times B)=\gamma(A \times B)+\int_{B}\left(1-f_{2}\right) \nu(d x)
$$

Therefore, the Equation (6) in the main text holds in this case.
Case 2: the Equation (6) in the main text is also true for this case because

$$
\hat{\gamma}(A \times(B \cup\{\hat{s}\}))=\hat{\gamma}(A \times B)+\hat{\gamma}(A \times\{\hat{s}\})=\gamma(A \times B)+\int_{A}\left(1-f_{1}\right) \mu(d x)
$$

Case 3: the Equation (6) in the main text is true as well since

$$
\begin{aligned}
\hat{\gamma}((A \cup\{\hat{s}\}) \times(B \cup\{\hat{s}\})) & =\hat{\gamma}(A \times B)+\hat{\gamma}(A \times\{\hat{s}\})+\hat{\gamma}(\{\hat{s}\} \times B)+\hat{\gamma}(\{\hat{s}\} \times\{\hat{s}\}) \\
& =\gamma(A \times B)+\int_{A}\left(1-f_{1}\right) \mu(d x)+\int_{B}\left(1-f_{2}\right) \nu(d x)+\gamma(\mathcal{T} \times \mathcal{T})
\end{aligned}
$$

Now as the Equation (6) in the main text holds, we obviously have $\gamma(U \times \mathcal{T}) \leq \hat{\gamma}(U \times \mathcal{T}) \leq \hat{\gamma}(U \times \hat{\mathcal{T}})=\hat{\mu}(U)=\mu(U)$ for any Borel set $U \subset \mathcal{T}$. Likewise, $\gamma(\mathcal{T} \times U) \leq \nu(U)$ for any Borel set $U \subset \mathcal{T}$. Therefore, $\gamma \in \Pi_{\leq}(\mu, \nu)$.

## A. 3 Proof for Proposition 3.3 in the main text

Proof. We first show that $\mathrm{KT}(\hat{\mu}, \hat{\nu}) \leq \operatorname{ET}_{c, \lambda}(\mu, \nu)$.
For any $\gamma \in \Pi_{\leq}(\mu, \nu)$, let $\hat{\gamma}$ be given by the Equation (6) in the main text. Then, $\hat{\gamma} \in \Gamma(\hat{\mu}, \hat{\nu})$ and

$$
\begin{aligned}
\mathrm{KT}(\hat{\mu}, \hat{\nu}) \leq \int_{\hat{\mathcal{T}} \times \hat{\mathcal{T}}} \hat{c}(x, y) \hat{\gamma}(d x, d y)= & b \int_{\mathcal{T} \times \mathcal{T}}[c(x, y)-\lambda] \gamma(d x, d y) \\
& +\int_{\mathcal{T}} w_{1}\left[1-f_{1}(x)\right] \mu(d x)+\int_{\mathcal{T}} w_{2}\left[1-f_{2}(x)\right] \nu(d x)
\end{aligned}
$$

It follows that $\mathrm{KT}(\hat{\mu}, \hat{\nu}) \leq \mathrm{ET}_{c, \lambda}(\mu, \nu)$.
We next show that $\operatorname{KT}(\hat{\mu}, \hat{\nu}) \geq \operatorname{ET}_{c, \lambda}(\mu, \nu)$. To see this, for any $\hat{\gamma} \in \Gamma(\hat{\mu}, \hat{\nu})$ we let $\gamma$ be the restriction of $\hat{\gamma}$ to $\mathcal{T}$. Then by Lemma 3.2 in the main text, we have $\gamma \in \Pi_{\leq}(\mu, \nu)$ and the Equation (6) in the main text holds. Consequently,

$$
\begin{aligned}
\int_{\hat{\mathcal{T}} \times \hat{\mathcal{T}}} \hat{c}(x, y) \hat{\gamma}(d x, d y)= & b \int_{\mathcal{T} \times \mathcal{T}}[c(x, y)-\lambda] \gamma(d x, d y) \\
& +\int_{\mathcal{T}} w_{1}\left[1-f_{1}(x)\right] \mu(d x)+\int_{\mathcal{T}} w_{2}\left[1-f_{2}(x)\right] \nu(d x) \\
\geq & \operatorname{ET}_{c, \lambda}(\mu, \nu)
\end{aligned}
$$

By taking the infimum over $\hat{\gamma}$, we infer that $\mathrm{KT}(\hat{\mu}, \hat{\nu}) \geq \mathrm{ET}_{c, \lambda}(\mu, \nu)$.
Thus we obtain

$$
\mathrm{KT}(\hat{\mu}, \hat{\nu})=\operatorname{ET}_{c, \lambda}(\mu, \nu)
$$

The relation about the optimal solutions also follows from the above arguments.

## A. 4 Proof for Theorem 3.4 in the main text

Proof. From Proposition 3.3 in the main text and the dual formulation for $\operatorname{KT}(\hat{\mu}, \hat{\nu})$ proved in [3, Corollary 2.6], we have

$$
\operatorname{ET}_{c, \lambda}(\mu, \nu)=\sup _{\substack{\hat{u} \in L^{1}(\hat{\mu}), \hat{v} \in L^{1}(\hat{\nu}) \\ \hat{u}(x)+\hat{v}(y) \leq \hat{c}(x, y)}} \int_{\hat{\mathcal{T}}} \hat{u}(x) \hat{\mu}(d x)+\int_{\hat{\mathcal{T}}} \hat{v}(x) \hat{\nu}(d x)=: I
$$

Therefore, it is enough to prove that $I=J$ where

$$
J:=\sup _{(u, v) \in \mathbb{K}}\left[\int_{\mathcal{T}} u(x) \mu(d x)+\int_{\mathcal{T}} v(x) \nu(d x)\right]
$$

For $(u, v)$ satisfying $u \leq w_{1}, v \leq w_{2}$ and $u(x)+v(y) \leq b[c(x, y)-\lambda]$, we extend it to $\hat{\mathcal{T}}$ by taking $\hat{u}(\hat{s})=0$ and $\hat{v}(\hat{s})=0$. Then, it is clear that $\hat{u}(x)+\hat{v}(y) \leq \hat{c}(x, y)$ for $x, y \in \hat{\mathcal{T}}$, and

$$
I \geq \int_{\hat{\mathcal{T}}} \hat{u}(x) \hat{\mu}(d x)+\int_{\hat{\mathcal{T}}} \hat{v}(x) \hat{\nu}(d x)=\int_{\mathcal{T}} u(x) \mu(d x)+\int_{\mathcal{T}} v(x) \nu(d x) .
$$

It follows that $I \geq J$. In order to prove the converse, let $(\hat{u}, \hat{v})$ be a maximizer for $I$. Then, by considering $(\hat{u}-\hat{u}(\hat{s}), \hat{v}+\hat{u}(\hat{s}))$, we can assume that $\hat{u}(\hat{s})=0$. Also, if we let $v(y):=\inf _{x \in \hat{\mathcal{T}}}[\hat{c}(x, y)-\hat{u}(x)]$, then $(\hat{u}, v)$ is still in the admissible class for $I$ and $\hat{v}(y) \leq v(y)$. This implies that $(\hat{u}, v)$ is also a maximizer for $I$. For these reasons, we can assume w.l.g. that the maximizer $(\hat{u}, \hat{v})$ has the following additional properties: $\hat{u}(\hat{s})=0$ and

$$
\hat{v}(y)=\inf _{x \in \hat{\mathcal{T}}}[\hat{c}(x, y)-\hat{u}(x)] \quad \forall y \in \hat{\mathcal{T}}
$$

In particular, $\hat{v}(\hat{s})=\inf _{x \in \hat{\mathcal{T}}}[\hat{c}(x, \hat{s})-\hat{u}(x)]$. For convenience, define $w_{1}(\hat{s})=0$ and consider the following two possibilities.

Case 1: $\inf _{x \in \hat{\mathcal{T}}}\left[w_{1}(x)-\hat{u}(x)\right] \geq 0$. Then, since $\hat{c}(\hat{s}, \hat{s})-\hat{u}(\hat{s})=0 \operatorname{and} \inf _{x \in \mathcal{T}}[\hat{c}(x, \hat{s})-\hat{u}(x)]=\inf _{x \in \mathcal{T}}\left[w_{1}(x)-\hat{u}(x)\right] \geq$ 0 , we have $\hat{v}(\hat{s})=0$. Also, $\hat{v}(y) \leq \hat{c}(\hat{s}, y)-\hat{u}(\hat{s}) \leq w_{2}(y)$ for all $y \in \hat{\mathcal{T}}$. For each $y \in \mathcal{T}$, by using the facts $\hat{u} \leq w_{1}$ and $\hat{c}(\hat{s}, y)-w_{1}(\hat{s})=w_{2}(y) \geq 0$ we get

$$
\hat{v}(y) \geq \inf _{x \in \hat{\mathcal{T}}}\left[\hat{c}(x, y)-w_{1}(x)\right]=\inf _{x \in \mathcal{T}}\left\{b[c(x, y)-\lambda]-w_{1}(x)\right\}=-b \lambda+\inf _{x \in \mathcal{T}}\left[b c(x, y)-w_{1}(x)\right]
$$

Thus $(\hat{u}, \hat{v}) \in \mathbb{K}$ and

$$
\begin{aligned}
I=\int_{\hat{\mathcal{T}}} \hat{u}(x) \hat{\mu}(d x)+\int_{\hat{\mathcal{T}}} \hat{v}(x) \hat{\nu}(d x) & =\int_{\mathcal{T}} \hat{u}(x) \hat{\mu}(d x)+\int_{\mathcal{T}} \hat{v}(x) \hat{\nu}(d x)+\hat{v}(\hat{s}) \mu(\mathcal{T}) \\
& =\int_{\mathcal{T}} \hat{u}(x) \mu(d x)+\int_{\mathcal{T}} \hat{v}(x) \nu(d x) \leq J
\end{aligned}
$$

Case 2: $\inf _{x \in \hat{\mathcal{T}}}\left[w_{1}(x)-\hat{u}(x)\right]<0$. Then, by arguing as in Case 1, we have $\hat{v}(\hat{s})=\inf _{x \in \mathcal{T}}\left[w_{1}(x)-\hat{u}(x)\right]<0$ and

$$
\begin{equation*}
I=\int_{\mathcal{T}} \hat{v}(x) \nu(d x)+\int_{\mathcal{T}} \hat{u}(x) \mu(d x)+\mu(\mathcal{T}) \inf _{\mathcal{T}}\left[w_{1}-\hat{u}\right] \tag{5}
\end{equation*}
$$

Let $\tilde{u}(x):=\min \left\{\hat{u}(x), w_{1}(x)\right\}$. Then, it is obvious that $\tilde{u}(x)+\hat{v}(y) \leq \hat{c}(x, y)$ and $\tilde{u}(\hat{s})=0 . \operatorname{Since} \inf _{x \in \mathcal{T}}\left[w_{1}(x)-\right.$ $\hat{u}(x)]<0$, there exists $x_{0} \in \mathcal{T}$ such that $w_{1}\left(x_{0}\right)<\hat{u}\left(x_{0}\right)$. Thus, $\tilde{u}\left(x_{0}\right)=w_{1}\left(x_{0}\right)$ and hence $\inf _{\mathcal{T}}\left[w_{1}-\tilde{u}\right] \leq 0$. As $\tilde{u} \leq w_{1}$, we infer further that $\inf _{\mathcal{T}}\left[w_{1}-\tilde{u}\right]=0$. We also have

$$
\begin{aligned}
& \int_{\mathcal{T}} \hat{u}(x) \mu(d x)+\mu(\mathcal{T}) \inf _{\mathcal{T}}\left[w_{1}-\hat{u}\right] \\
& =\int_{\mathcal{T}} \tilde{u}(x) \mu(d x)+\int_{\mathcal{T}: \hat{u}>w_{1}}\left[\hat{u}(x)-w_{1}(x)\right] \mu(d x)+\mu(\mathcal{T}) \inf _{\mathcal{T}}\left[w_{1}-\hat{u}\right] \leq \int_{\mathcal{T}} \tilde{u}(x) \mu(d x)
\end{aligned}
$$

This together with 5 gives

$$
I \leq \int_{\mathcal{T}} \tilde{u}(x) \mu(d x)+\int_{\mathcal{T}} \hat{v}(x) \nu(d x)
$$

Now let $\tilde{v}(y)=\inf _{x \in \hat{\mathcal{T}}}[\hat{c}(x, y)-\tilde{u}(x)]$ for $y \in \mathcal{T}$. Then, $\hat{v}(y) \leq \tilde{v}(y) \leq \hat{c}(\hat{s}, y)-\tilde{u}(\hat{s})=w_{2}(y)$ for $y \in \mathcal{T}$. For each $y \in \mathcal{T}$, by using the facts $\tilde{u} \leq w_{1}$ and $\hat{c}(\hat{s}, y)-w_{1}(\hat{s})=w_{2}(y) \geq 0$ we also get

$$
\tilde{v}(y) \geq \inf _{x \in \hat{\mathcal{T}}}\left[\hat{c}(x, y)-w_{1}(x)\right]=\inf _{x \in \mathcal{T}}\left\{b[c(x, y)-\lambda]-w_{1}(x)\right\}=-b \lambda+\inf _{x \in \mathcal{T}}\left[b c(x, y)-w_{1}(x)\right]
$$

It follows that $(\tilde{u}, \tilde{v}) \in \mathbb{K}$ and

$$
I \leq \int_{\mathcal{T}} \tilde{u}(x) \mu(d x)+\int_{\mathcal{T}} \tilde{v}(x) \nu(d x) \leq J
$$

Thus we conclude that $I=J$ and the theorem follows.

## A. 5 Proof for Corollary 3.5 in the main text

Proof. Notice that as $w_{i}(i=1,2)$ is $b$-Lipschitz, we have for every $x \in \mathcal{T}$ that

$$
\begin{equation*}
-w_{i}(x) \leq \inf _{y \in \mathcal{T}}\left[b d_{\mathcal{T}}(x, y)-w_{i}(y)\right] \tag{6}
\end{equation*}
$$

For each $(u, v) \in \mathbb{K}$, let

$$
\begin{aligned}
v^{*}(x) & :=\inf _{y \in \mathcal{T}}\left\{b\left[d_{\mathcal{T}}(x, y)-\lambda\right]-v(y)\right\}=-b \lambda+\inf _{y \in \mathcal{T}}\left[b d_{\mathcal{T}}(x, y)-v(y)\right] \geq u(x) \\
v^{* *}(y) & :=\inf _{x \in \mathcal{T}}\left\{b\left[d_{\mathcal{T}}(x, y)-\lambda\right]-v^{*}(x)\right\}=-b \lambda+\inf _{x \in \mathcal{T}}\left[b d_{\mathcal{T}}(x, y)-v^{*}(x)\right] \geq v(y)
\end{aligned}
$$

By using $-b \lambda+\inf _{x \in \mathcal{T}}\left[b d_{\mathcal{T}}(x, y)-w_{1}(x)\right] \leq v(y) \leq w_{2}(y)$ and (6), we obtain for every $x \in \mathcal{T}$ that

$$
\begin{aligned}
& v^{*}(x) \leq-b \lambda-v(x) \leq-\inf _{y \in \mathcal{T}}\left[b d \mathcal{T}(x, y)-w_{1}(y)\right] \leq w_{1}(x) \\
& v^{*}(x) \geq-b \lambda+\inf _{y \in \mathcal{T}}\left[b d_{\mathcal{T}}(x, y)-w_{2}(y)\right] \geq-b \lambda-w_{2}(x)
\end{aligned}
$$

We also have $v^{*}$ is $b$-Lipschitz, i.e., $\left|v^{*}\left(x_{1}\right)-v^{*}\left(x_{2}\right)\right| \leq b d_{\mathcal{T}}\left(x_{1}, x_{2}\right)$. Indeed, let $x_{1}, x_{2} \in \mathcal{T}$. Then for any $\varepsilon>0$, there exists $y_{1} \in \mathcal{T}$ such that $b d_{\mathcal{T}}\left(x_{1}, y_{1}\right)-v\left(y_{1}\right)<v^{*}\left(x_{1}\right)+b \lambda+\varepsilon$. It follows that

$$
v^{*}\left(x_{2}\right)-v^{*}\left(x_{1}\right) \leq b d_{\mathcal{T}}\left(x_{2}, y_{1}\right)-v\left(y_{1}\right)+\varepsilon-\left[b d_{\mathcal{T}}\left(x_{1}, y_{1}\right)-v\left(y_{1}\right)\right] \leq b d_{\mathcal{T}}\left(x_{1}, x_{2}\right)+\varepsilon
$$

Since this holds for every $\varepsilon>0$, we get $v^{*}\left(x_{2}\right)-v^{*}\left(x_{1}\right) \leq b d_{\mathcal{T}}\left(x_{1}, x_{2}\right)$. By interchanging the role of $x_{1}$ and $x_{2}$, we also obtain $v^{*}\left(x_{1}\right)-v^{*}\left(x_{2}\right) \leq b d_{\mathcal{T}}\left(x_{1}, x_{2}\right)$. Thus, $\left|v^{*}\left(x_{1}\right)-v^{*}\left(x_{2}\right)\right| \leq b d_{\mathcal{T}}\left(x_{1}, x_{2}\right)$. Hence, we have shown that $v^{*} \in \mathbb{L}^{\prime}$ with

$$
\mathbb{L}^{\prime}:=\left\{f \in C(\mathcal{T}):-b \lambda-w_{2} \leq f \leq w_{1},|f(x)-f(y)| \leq b d_{\mathcal{T}}(x, y)\right\}
$$

We next claim $v^{* *}=-b \lambda-v^{*}$. For this, it is clear from the definition that $v^{* *}(y) \leq-b \lambda-v^{*}(y)$. On the other hand, from the Lipschitz property of $v^{*}$ we obtain

$$
-v^{*}(y) \leq b d_{\mathcal{T}}(x, y)-v^{*}(x) \quad \forall x \in \mathcal{T}
$$

which gives $-b \lambda-v^{*}(y) \leq v^{* *}(y)$. Thus, we conclude that $v^{* *}=-b \lambda-v^{*}$ as claimed.
From these, we obtain that

$$
\begin{aligned}
\int_{\mathcal{T}} u(x) \mu(d x)+\int_{\mathcal{T}} v(x) \nu(d x) & \leq \int_{\mathcal{T}} v^{*}(x) \mu(d x)+\int_{\mathcal{T}} v^{* *}(x) \nu(d x) \\
& =\int_{\mathcal{T}} v^{*}(x) \mu(d x)-\int_{\mathcal{T}} v^{*}(x) \nu(d x)-b \lambda \nu(\mathcal{T}) \\
& \leq-b \lambda \nu(\mathcal{T})+\sup \left\{\int_{\mathcal{T}} f(\mu-\nu): f \in \mathbb{L}^{\prime}\right\}
\end{aligned}
$$

This together with Theorem 3.4 in the main text implies that $\operatorname{ET}_{\lambda}(\mu, \nu) \leq-b \lambda \nu(\mathcal{T})+\sup \left\{\int_{\mathcal{T}} f(\mu-\nu): f \in \mathbb{L}^{\prime}\right\}$. To prove the converse, let $f \in \mathbb{L}^{\prime}$. Define $u:=f$ and $v:=-b \lambda-f$. Then, we have $u(x) \leq w_{1}(x), v(x) \leq$ $-b \lambda-\left[-b \lambda-w_{2}(x)\right]=w_{2}(x)$, and

$$
v(x) \geq-b \lambda-w_{1}(x) \geq-b \lambda+\inf _{y \in \mathcal{T}}\left[b d \mathcal{T}(x, y)-w_{1}(y)\right]
$$

Also, the Lipschitz property of $f$ gives

$$
u(x)+v(y)=-b \lambda+f(x)-f(y) \leq b\left[d_{\mathcal{T}}(x, y)-\lambda\right] \quad \forall x, y \in \mathcal{T}
$$

Thus $(u, v) \in \mathbb{K}$, and hence we obtain from Theorem 3.4 in the main text that

$$
-b \lambda \nu(\mathcal{T})+\int_{\mathcal{T}} f(\mu-\nu)=\int_{\mathcal{T}} u(x) \mu(d x)+\int_{\mathcal{T}} v(x) \nu(d x) \leq \operatorname{ET}_{\lambda}(\mu, \nu)
$$

As this holds for every $f \in \mathbb{L}^{\prime}$, we get

$$
-b \lambda \nu(\mathcal{T})+\sup \left\{\int_{\mathcal{T}} f(\mu-\nu): f \in \mathbb{L}^{\prime}\right\} \leq \operatorname{ET}_{\lambda}(\mu, \nu)
$$

Thus, we have shown that

$$
\begin{equation*}
\mathrm{ET}_{\lambda}(\mu, \nu)=-b \lambda \nu(\mathcal{T})+\sup \left\{\int_{\mathcal{T}} f(\mu-\nu): f \in \mathbb{L}^{\prime}\right\} \tag{7}
\end{equation*}
$$

Now consider $f=\tilde{f}-\frac{b \lambda}{2}$. Then, $f \in \mathbb{L}^{\prime}$ if and only if $\tilde{f} \in \mathbb{L}$. Moreover,

$$
\int_{\mathcal{T}} f(\mu-\nu)=-\frac{b \lambda}{2}[\mu(\mathcal{T})-\nu(\mathcal{T})]+\int_{\mathcal{T}} \tilde{f}(\mu-\nu)
$$

Therefore, the conclusion of the corollary follows from (7).

## A. 6 Proof for Proposition 3.7 in the main text

In order to prove Proposition 3.7 in the main text, we need the following auxiliary result.
Lemma A.1. Assume that $w_{1}>0$ and $w_{2}>0$. Then, $d(\mu, \nu)=0$ implies that $\mu=\nu$.
Proof. Assume that $d(\mu, \nu)=0$. Let $\gamma^{0}$ be an optimal plan for $\operatorname{ET}_{\lambda}(\mu, \nu)$, and set $m:=\gamma^{0}(\mathcal{T} \times \mathcal{T})$. Then, $m \leq \min \{\mu(\mathcal{T}), \nu(\mathcal{T})\}$, and hence we obtain from Problem (3) in the main text that

$$
\begin{aligned}
& \int_{\mathcal{T}} w_{1}\left[1-f_{1}(x)\right] \mu(d x)+\int_{\mathcal{T}} w_{2}\left[1-f_{2}(x)\right] \nu(d x)+b \int_{\mathcal{T} \times \mathcal{T}} d \mathcal{T}(x, y) \gamma^{0}(d x, d y) \\
& =\operatorname{ET}_{\lambda}(\mu, \nu)+\lambda b m \leq \operatorname{ET}_{\lambda}(\mu, \nu)+\frac{b \lambda}{2}[\mu(\mathcal{T})+\nu(\mathcal{T})]=d(\mu, \nu)=0
\end{aligned}
$$

Thus,

$$
\int_{\mathcal{T}} w_{1}\left[1-f_{1}(x)\right] \mu(d x)=\int_{\mathcal{T}} w_{2}\left[1-f_{2}(x)\right] \nu(d x)=\int_{\mathcal{T} \times \mathcal{T}} d_{\mathcal{T}}(x, y) \gamma^{0}(d x, d y)=0
$$

Since $w_{1}$ and $w_{2}$ are positive, it follows in particular that $f_{1}=1 \mu$-a.e. and $f_{2}=1 \nu$-a.e. That is, $\gamma_{1}^{0}=\mu$ and $\gamma_{2}^{0}=\nu$. Moreover, the above last identity implies that $\gamma^{0}$ is supported on the diagonal $(y=x)$. Therefore, for any continuous function $\varphi$ on $\mathcal{T}$ we have

$$
\int_{\mathcal{T}} \varphi(x) \mu(d x)=\int_{\mathcal{T} \times \mathcal{T}} \varphi(x) \gamma^{0}(d x, d y)=\int_{\mathcal{T} \times \mathcal{T}} \varphi(y) \gamma^{0}(d x, d y)=\int_{\mathcal{T}} \varphi(y) \nu(d y)
$$

We thus conclude that $\mu=\nu$.
Proof. [Of Proposition 3.7 in the main text]
i) This follows immediately from Corollary 3.5 in the main text.
ii) By Corollary 3.5 in the main text, it is clear that $d(\mu, \nu) \geq 0$ and $d(\mu, \mu)=0$. Also, if $d(\mu, \nu)=0$, then by Lemma A. 1 , we have $\mu=\nu$. It is obvious that $d$ satisfies the triangle inequality.
iii) Due to the assumption $w_{1}=w_{2}$ we have $f \in \mathbb{L}$ if and only if $-f \in \mathbb{L}$. It follows that $d(\mu, \nu)=d(\nu, \mu)$. This together with ii) implies that $(\mathcal{M}(\mathcal{T}), d)$ is a metric space. Its completeness follows from [13, Proposition 4]. As a complete metric space, it is well known that $(\mathcal{M}(\mathcal{T}), d)$ is a geodesic space if and only if for every $\mu, \nu \in \mathcal{M}(\mathcal{T})$ there exists $\sigma \in \mathcal{M}(\mathcal{T})$ such that

$$
d(\mu, \sigma)=d(\nu, \sigma)=\frac{1}{2} d(\mu, \nu)
$$

To verify the latter, take $\sigma:=\frac{\mu+\nu}{2}$. Then using Corollary 3.5 in the main text, we obtain

$$
d(\mu, \sigma)=\frac{1}{2} \sup _{f \in \mathbb{L}} \int_{\mathcal{T}} f(\mu-\nu)=\frac{1}{2} d(\mu, \nu)
$$

and

$$
d(\nu, \sigma)=\frac{1}{2} \sup _{f \in \mathbb{L}} \int_{\mathcal{T}} f(\nu-\mu)=\frac{1}{2} d(\nu, \mu)=\frac{1}{2} d(\mu, \nu)
$$

## A. 7 Proof for Proposition 3.8 in the main text

Proof. Observe that

$$
\begin{aligned}
\widetilde{\operatorname{ET}}_{\lambda}^{\alpha}(\mu, \nu)= & -\frac{b \lambda}{2}[\mu(\mathcal{T})+\nu(\mathcal{T})] \\
& +\sup \left\{s[\mu(\mathcal{T})-\nu(\mathcal{T})]: s \in\left[-\frac{b \lambda}{2}-w_{2}(r)+\alpha, w_{1}(r)+\frac{b \lambda}{2}-\alpha\right]\right\} \\
& +\sup \left\{\int_{\mathcal{T}}\left[\int_{[r, x]} g(y) \omega(d y](\mu-\nu)(d x):\|g\|_{L^{\infty}(\mathcal{T})} \leq b\right\} .\right.
\end{aligned}
$$

The first supremum equals to $\left[w_{1}(r)+\frac{b \lambda}{2}-\alpha\right][\mu(\mathcal{T})-\nu(\mathcal{T})]$ if $\mu(\mathcal{T}) \geq \nu(\mathcal{T})$ and equals to $-\left[w_{2}(r)+\frac{b \lambda}{2}-\right.$ $\alpha][\mu(\mathcal{T})-\nu(\mathcal{T})]$ if $\mu(\mathcal{T})<\nu(\mathcal{T})$. On the other hand, by the same arguments as in [4, p.575-576], we see that the second supremum equals to $\int_{\mathcal{T}}|\mu(\Lambda(x))-\nu(\Lambda(x))| \omega(d x)$. Putting them together, we obtain the desired formula for $\widetilde{\mathrm{ET}}_{\lambda}^{\alpha}(\mu, \nu)$.

## A. 8 Proof for Proposition 3.9 in the main text

Proof. The inequality $\mathrm{ET}_{\lambda}(\mu, \nu) \leq \widetilde{\mathrm{ET}}_{\lambda}^{0}(\mu, \nu)$ holds due to $\mathbb{L} \subset \mathbb{L}_{0}$ and Corollary 3.5 in the main text. Next, let

$$
2 b L(\mathcal{T}) \leq \alpha \leq \frac{1}{2}\left[b \lambda+w_{1}(r)+w_{2}(r)\right]
$$

Then, thanks to Corollary 3.5 in the main text, the stated lower bound will follow if $\mathbb{L}_{\alpha} \subset \mathbb{L}$. This is achieved if we can show that any $f \in \mathbb{L}_{\alpha}$ satisfies $-w_{2}-\frac{b \lambda}{2} \leq f \leq w_{1}+\frac{b \lambda}{2}$. Indeed, for such function $f$ we have

$$
f(x)=s+\int_{[r, x]} g(y) \omega(d y)
$$

with $s \in\left[-w_{2}(r)-\frac{b \lambda}{2}+\alpha, w_{1}(r)+\frac{b \lambda}{2}-\alpha\right]$ and $\|g\|_{L^{\infty}(\mathcal{T})} \leq b$. This together the $b$-Lipschitz property of $w_{1}, w_{2}$ gives for every $x \in \mathcal{T}$ that

$$
f(x) \leq s+\|g\|_{L^{\infty}(\mathcal{T})} \omega([r, x]) \leq w_{1}(r)+\frac{b \lambda}{2}-\alpha+b L(\mathcal{T}) \leq w_{1}(x)+\frac{b \lambda}{2}-\alpha+2 b L(\mathcal{T}) \leq w_{1}(x)+\frac{b \lambda}{2}
$$

and

$$
\begin{aligned}
f(x) & \geq s-\|g\|_{L^{\infty}(\mathcal{T})} \omega([r, x]) \geq-w_{2}(r)-\frac{b \lambda}{2}+\alpha-b L(\mathcal{T}) \\
& \geq-w_{2}(x)-\frac{b \lambda}{2}+\alpha-2 b L(\mathcal{T}) \geq-w_{2}(x)-\frac{b \lambda}{2}
\end{aligned}
$$

It follows that $f \in \mathbb{L}$. Thus, $\mathbb{L}_{\alpha} \subset \mathbb{L}$ and we obtain

$$
\widetilde{\operatorname{ET}}_{\lambda}^{\alpha}(\mu, \nu) \leq \operatorname{ET}_{\lambda}(\mu, \nu)
$$

## A. 9 Proof of Proposition 3.10 in the main text

We begin with the following auxiliary result.
Lemma A.2. Let $\mu, \nu \in \mathcal{M}(\mathcal{T})$. Then, $\mu=\nu$ if and only if $\mu(\Lambda(x))=\nu(\Lambda(x))$ for every $x$ in $\mathcal{T}$.
Proof. It is obvious that $\mu=\nu$ implies that $\mu(\Lambda(x))=\nu(\Lambda(x))$ for every $x$ in $\mathcal{T}$. Now assume that $\mu(\Lambda(x))=$ $\nu(\Lambda(x))$ for every $x$ in $\mathcal{T}$. We first claim that $\mu(\{a\})=\nu(\{a\})$ for any $a \in \mathcal{T}$. Indeed, if $a$ is not a node then we have $\Lambda(a) \backslash \Lambda\left(a_{n}\right) \downarrow\{a\}$, where $\left\{a_{n}\right\}_{n=1}^{\infty}$ is a sequence of distinct points on the same edge as $a$ and converges to $a$ from below. Hence,

$$
\mu(\{a\})=\lim _{n \rightarrow \infty}\left[\mu(\Lambda(a))-\mu\left(\Lambda\left(a_{n}\right)\right)\right]=\lim _{n \rightarrow \infty}\left[\nu(\Lambda(a))-\nu\left(\Lambda\left(a_{n}\right)\right)\right]=\nu(\{a\}) .
$$

In case $a$ is a common node for edges $e_{1}, \ldots, e_{k}$, then we have $\Gamma(a) \backslash \cup_{i=1}^{k} \Gamma\left(a_{n}^{i}\right) \downarrow\{a\}$, where $\left\{a_{n}^{i}\right\}_{n=1}^{\infty}$ is a sequence of distinct points on edge $e_{i}$ that converges to $a$ from below. Then, we obtain

$$
\mu(\{a\})=\lim _{n \rightarrow \infty}\left[\mu(\Lambda(a))-\sum_{i=1}^{k} \mu\left(\Lambda\left(a_{n}^{i}\right)\right)\right]=\lim _{n \rightarrow \infty}\left[\nu(\Lambda(a))-\sum_{i=1}^{k} \nu\left(\Lambda\left(a_{n}^{i}\right)\right)\right]=\nu(\{a\})
$$

Thus, the claim is proved. On the other hand, for any points $x, y$ belonging to the same edge

$$
\mu([x, y))=\mu(\Lambda(x))-\mu(\Lambda(y))=\nu(\Lambda(x))-\nu(\Lambda(y))=\nu([x, y))
$$

Thus, by combining them, we infer further that $\mu([x, y])=\nu([x, y])$ for any $x, y \in \mathcal{T}$. It follows that $\mu=\nu$, and the proof is complete.

Proof. [Of Proposition 3.10 in the main text] We note first that the quantity $d_{\alpha}$ depends only on the values of the weights at the root $r$ of the tree. This comes from the fact that only $w_{1}(r)$ and $w_{2}(r)$ are used in the definition of $\mathbb{L}_{\alpha}$. The proofs of i) and iii) are exactly the same as that of Proposition 3.7 in the main text.
For ii), it follows from the fact

$$
d_{\alpha}(\mu, \nu)=\sup \left\{\int_{\mathcal{T}} f(\mu-\nu): f \in \mathbb{L}_{\alpha}\right\}
$$

that $d_{\alpha}(\mu, \nu) \geq 0, d_{\alpha}(\mu, \mu)=0$, and $d_{\alpha}$ satisfies the triangle inequality. Also, if $d_{\alpha}(\mu, \nu)=0$, then by Proposition 3.8 in the main text, we get

$$
\left[w_{i}(r)+\frac{b \lambda}{2}-\alpha\right]|\mu(\mathcal{T})-\nu(\mathcal{T})|+\int_{\mathcal{T}}|\mu(\Lambda(x))-\nu(\Lambda(x))| \omega(d x)=0
$$

As $\left[w_{i}(r)+\frac{b \lambda}{2}-\alpha\right]>0$ by the assumption, we must have $\mu(\mathcal{T})=\nu(\mathcal{T})$ and $\int_{\mathcal{T}}|\mu(\Lambda(x))-\nu(\Lambda(x))| \omega(d x)=0$. Therefore, $\mu(\Lambda(x))=\nu(\Lambda(x))$ for every $x \in \mathcal{T}$. By using Lemma A. 2 , we then conclude that $\mu=\nu$.

Alternatively, we can argue as follows. Assume that $d_{\alpha}(\mu, \nu)=0$. Since

$$
\mathbb{L}_{\alpha} \supset \tilde{\mathbb{L}}:=\left\{f:-w_{2}(r)-\frac{b \lambda}{2}+\alpha \leq f(x) \leq w_{1}(r)+\frac{b \lambda}{2}-\alpha,\|f\|_{L i p(\mathcal{T})} \leq b\right\}
$$

we have

$$
0 \leq \sup _{f \in \widetilde{\mathbb{L}}} \int_{\mathcal{T}} f(\mu-\nu) \leq d_{\alpha}(\mu, \nu)=0
$$

Thus, $\sup _{f \in \tilde{\mathbb{L}}} \int_{\mathcal{T}} f(\mu-\nu)=0$. Then, by applying Corollary 3.5 in the main text and Lemma A. 1 for constant weights $\tilde{w}_{1}:=w_{1}(r)+\frac{b \lambda}{2}-\alpha>0$ and $\tilde{w}_{2}:=w_{2}(r)+\frac{b \lambda}{2}-\alpha>0$, we obtain that $\mu=\nu$.

## A. 10 Proof for Proposition 3.11 in the main text

Proof. Let $\mathbf{f}\left(x_{i}, x_{j}\right)=\tilde{a}\left(x_{i}+x_{j}\right)$ for $\tilde{a}, x_{i}, x_{j} \in \mathbb{R}$. We first prove that $\mathbf{f}$ is negative definite.
For all $n \geq 2$, for $c_{1}, c_{2}, \ldots, c_{n}$ such that $\sum_{i=1}^{n} c_{i}=0$. Given $x_{1}, x_{2}, \ldots, x_{n} \in \mathbb{R}$, we have

$$
\sum_{i, j} c_{i} c_{j} \mathbf{f}\left(x_{i}, x_{j}\right)=\sum_{i, j} c_{i} c_{j} \tilde{a} x_{i}+\sum_{i, j} c_{i} c_{j} \tilde{a} x_{j} \leq 0
$$

Therefore, $\mathbf{f}$ is negative definite.
From Proposition 3.8 in the main text, we have

$$
\widetilde{\operatorname{ET}}_{\lambda}^{\alpha}(\mu, \nu)=-\frac{b \lambda}{2}[\mu(\mathcal{T})+\nu(\mathcal{T})]+\left[w_{i}(r)+\frac{b \lambda}{2}-\alpha\right]|\mu(\mathcal{T})-\nu(\mathcal{T})|+\int_{\mathcal{T}}|\mu(\Lambda(x))-\nu(\Lambda(x))| \omega(d x)
$$

The first term is negative definite since $\mathbf{f}$ is negative definite. Additionally, the second and third terms are equivalent to the weighted $\ell_{1}$ distance with nonnegative weights (i.e., $\alpha \leq w_{i}(r)+\frac{b \lambda}{2}$ and lengths of edges in tree $\mathcal{T}$ are nonnegative). Therefore, the second and third terms are also negative definite. Hence, $\widetilde{\mathrm{ET}}_{\lambda}^{\alpha}$ is negative definite.

From Proposition 3.10 in the main text, we have

$$
d_{\alpha}(\mu, \nu)=\widetilde{\operatorname{ET}}_{\lambda}^{\alpha}(\mu, \nu)+\frac{b \lambda}{2}[\mu(\mathcal{T})+\nu(\mathcal{T})]
$$

Both terms are negative definite. Therefore, $d_{\alpha}$ is also negative definite.

## B Further Experimental Results

In this section, we illustrate further experimental results.

## B. 1 Further Results on the Efficient Approximation of $\widetilde{E T}_{\lambda}^{0}$ for $\mathrm{ET}_{\lambda}$

In this section, we consider some further setups.
Change $\lambda$. In Figure 1a. we use the same setup as in Figure 2 in the main text, but set the Lipschitz $a_{1}=\frac{b}{2}=0.5$ for $w_{1}, w_{2}$. It shows that when $\lambda$ is increased, $\widetilde{\operatorname{ET}}_{\lambda}^{0}$ is farther to $\mathrm{ET}_{\lambda}$.

(a)

(b)

(c)

Figure 1: In (a), an illustration about the relative difference between $\widetilde{\mathrm{ET}}_{\lambda}^{0}$ and $\mathrm{ET}_{\lambda}$ w.r.t. $\lambda$. LT is the longest path from a root to a node in tree $\mathcal{T}\left(\mathrm{LT}:=L_{\mathcal{T}}\right)$. Lipchitz for functions $w_{1}, w_{2}$ is $a_{1}=0.5$ (where $b=1$ ). In $\sqrt{b}$, c), an illustration about the absolute relative difference between $\widetilde{\mathrm{ET}}_{\lambda}^{0}$ and $\mathrm{ET}_{\lambda}$, i.e., $\left(\widetilde{\mathrm{ET}}_{\lambda}^{0}-\mathrm{ET}_{\lambda}\right) /\left|E T_{\lambda}\right|$, w.r.t. $b$. For (b), the weight functions $w_{1}, w_{2}$ are set constants $\left(a_{1}=0\right.$, or $\left.w_{1}=w_{2}=a_{0}\right)$ while for (c), the weight functions $w_{1}, w_{2}$ are set with largest Lipchitz $\left(a_{1}=b\right)$.

Change $b$. We consider 2 following cases:

- For constant functions $w_{1}, w_{2}$ (with $a_{1}=0$ ). We use the same setup as in Figure 1 in the main text, but with constant functions for $w_{1}, w_{2}$ (i.e., $a_{1}=0$, or $w_{1}=w_{2}=a_{0}$ ), and change $b$. We set $\lambda=a_{0}=1$. In Figure 1 b , we illustrate that when the regularization $b$ between entropy and partial matching is farther to 1 (one of the two terms is more weighted, see Equation (2) in the main text), $\widetilde{\mathrm{ET}}_{\lambda}^{0}$ is farther to $\mathrm{ET}_{\lambda}$.
- For functions $w_{1}$, $w_{2}$ with largest Lipschitz $a_{1}=b$. We use the same setup as in Figure 1b, but with $a_{1}=b$. Figure 1 C shows similar results as in Figure 1 b for $a_{1}=0$. For the largest Lipchitz for functions $w_{1}, w_{2}$ (i.e., $a_{1}=b$ ), but for $b=a_{0}=1, \widetilde{\mathrm{ET}}$ is almost identical to KT, but they are different when when the regularization $b$ between entropy and partial matching is farther to 1 (one of the two terms is more weighted, see Equation (2) in the main text).

## B. 2 Further Results w.r.t. $\alpha$

We illustrate further SVM results of $d_{\alpha}$ and $\widetilde{E T}_{\lambda}^{\alpha}$ w.r.t. value of $\alpha$ in TWITTER, RECIPE, CLASSIC, AMAZON datasets in Figure 2a, and in Orbit, MPEG7 datasets in Figure 2b. The value of $\alpha$ may affect performances of $d_{\alpha}$ and $\widetilde{E T}_{\lambda}^{\alpha}$ in some datasets (e.g., RECIPE, AMAZON datasets for document classification, and Orbit dataset in TDA), but may not sensitive in some other datasets (e.g., TWITTER, CLASSIC datasets for document classification, and MPEG7 dataset in TDA). Therefore, although $\alpha=0$ gives $\widetilde{E T}_{\lambda}^{\alpha}$ good property as in Proposition 3.9 in the main text (upper bound for $\mathrm{ET}_{\lambda}$ ), there is a possibility to choose suitable value for $\alpha$ (e.g., via cross validation) to improve performances of $d_{\alpha}$ and $\widetilde{\mathrm{ET}}_{\lambda}^{\alpha}$ for some certain datasets.

Figure 2: SVM results of $d_{\alpha}$ and $\widetilde{\mathrm{ET}}_{\lambda}^{\alpha}$ w.r.t. value of $\alpha$ with 10 tree slices.

## B. 3 Further Results w.r.t. the Number of (Tree) Slices

Similar as Figure 6 in the main text, we illustrate further SVM results and time consumption for corresponding kernel matrices for document classification (e.g., TWITTER, RECIPE, CLASSIC, AMAZON datasets) and TDA (Orbit, MPEG7 datasets in Figure 3a and Figure 3b respectively. For a trade-off between performances and time consumption, one can choose about $n_{s}=10$ slices in applications.

Figure 3: SVM results and time consumption for corresponding kernel matrices w.r.t. the number of (tree) slices.

## B. 4 Further Results w.r.t. Parameters of Tree Metric Sampling

## Document classification.

- In Figure 4a, Figure 4b, Figure 4c, Figure 4d, we illustrate further SVM results and time consumption for corresponding kernel matrices of $d_{0}$ in TWITTER, RECIPE, CLASSIC, AMAZON datasets respectively w.r.t. different parameters for clustering-based tree metric sampling such as the predefined tree deepest level $H_{\mathcal{T}}$, and number of tree branches $\kappa$ which is the number of clusters in the farthest-point clustering.
- In Figure 5a, Figure 5b, Figure 5 c, Figure 5 d , we illustrate further SVM results and time consumption for corresponding kernel matrices of $\widetilde{\mathrm{ET}}_{\lambda}^{0}$ in TWITTER, RECIPE, CLASSIC, AMAZON datasets respectively w.r.t. different parameters for clustering-based tree metric sampling such as the predefined tree deepest level $H_{\mathcal{T}}$, and number of tree branches $\kappa$ which is the number of clusters in the farthest-point clustering.

TDA.

- In Figure 6a, we illustrate further SVM results and time consumption for corresponding kernel matrices of $d_{0}$ in Orbit, MPEG7 datasets w.r.t. different parameters for partition-based tree metric sampling such as the predefined tree deepest level $H_{\mathcal{T}}$.
- In Figure 6b, we illustrate further SVM results and time consumption for corresponding kernel matrices of $\widetilde{\mathrm{ET}}_{\lambda}^{0}$ in Orbit, MPEG7 datasets w.r.t. different parameters for partition-based tree metric sampling such as the predefined tree deepest level $H_{\mathcal{T}}$.

Similar as in [12] (tree metric sampling for tree-sliced-Wasserstein in applications), we also observed that the default parameters (e.g., the predefined deepest level $H_{\mathcal{T}}=6$, and the tree branches $\kappa=4$-the number of clusters in the farthest-point clustering) is a reasonable choice to trade-off about performances and time consumption. With these default parameters, sampled trees contains about 4000 nodes.

## C Further Details and Discussions

In this section, we give further details about experiments, some brief reviews about important aspects used in our work and discuss other relations to other work.

Figure 4: SVM results and time consumption for corresponding kernel matrices of $d_{0}$ w.r.t. different parameters for clustering-based tree metric sampling (predefined tree deepest level $H_{\mathcal{T}}$, and number of tree branches $\kappa$-the number of clusters in the farthest-point clustering.).

## C. 1 More Details about Experiments

In this section, we give further details about softwares, datasets and experimental setups.

## For softwares.

- For experiments in topological data analysis, we used DIPHA toolbox, available at https://github.com/ DIPHA/dipha to extract persistence diagrams.
- For the standard complete optimal transport (OT) problem (e.g., KT in our work which we used to compute the corresponding $\mathrm{ET}_{\lambda}$ ), we used a fast OT implementation, available at https://github.com/gpeyre/ 2017-ot-beginners/tree/master/matlab/mexEMD. It is about 4 times faster than the popular mex-file with Rubner's implementation in C, available at http://robotics.stanford.edu/~rubner/emd/default.htm.
- For tree metric sampling, we used the MATLAB implementation, available at https://github.com/lttam/ TreeWasserstein. We directly used this code for clustering-based tree metric sampling, and adapted it into its special case partition-based tree metric sampling.
- For Sinkhorn-based approach for unbalanced OT (Sinkhorn-UOT), we used the MATLAB implementation, available at https://github.com/gpeyre/2017-MCOM-unbalanced-ot.
- For sliced partial optimal transport (SPOT), we adapt the $\mathrm{C}++$ implementation, available at https: //github.com/nbonneel/spot, into MATLAB.

## For datasets.

- For document datasets (e.g., TWITTER, RECIPE, CLASSIC, AMAZON), they are available at https://github com/mkusner/wmd.

Figure 5: SVM results and time consumption for corresponding kernel matrices of $\widetilde{\mathrm{ET}}_{\lambda}^{0}$ w.r.t. different parameters for clustering-based tree metric sampling (predefined tree deepest level $H_{\mathcal{T}}$, and number of tree branches $\kappa$ - the number of clusters in the farthest-point clustering.).

- For Orbit dataset, we follow the procedure, detailed in [1] to generate the dataset.
- For MPEG7 dataset, it is available at http://www.imageprocessingplace.com/downloads_V3/root_ downloads/image_databases/MPEG7_CE-Shape-1_Part_B.zip, then we follow [12] to extract the 10-class subset of the dataset.
- For granular packing system and $\mathrm{SiO}_{2}$ datasets, one may access to them by contacting the corresponding authors.

For experimental setups. We further clarify some details about experimental setup.
As mentioned in the main text, for $d_{0}$ and $\widetilde{\mathrm{ET}}_{\lambda}^{0}$, we choose the weight functions for $w_{1}, w_{2}$ as

$$
w_{1}(x)=w_{2}(x)=a_{1} d_{\mathcal{T}}(r, x)+a_{0},
$$

where $r$ is the root of tree $\mathcal{T}$, we set $\lambda=b=1, a_{0}=1$. Following $\S 5.1$ in the main text, we set $a_{1}=b=1$. As in $\S 3.2$ in the main text, $\alpha \in\left[0, \frac{1}{2}\left(b \lambda+w_{1}(r)+w_{2}(r)\right)\right]$. Thus, $\alpha \in\left[0, \frac{3}{2}\right]$ in our experiments (see more experiment results with different values of $\alpha$ in 8 B.2 . We used $n_{s}=10$ (tree) slices for $d_{0}, \widetilde{\mathrm{ET}}_{\lambda}^{0}$ and SPOT. For tree metric sampling, we used the default hyperparameters, the predefined tree deepest level $H_{\mathcal{T}}=6$, and the tree branches $\kappa=4$-the number of clusters used in the farthest-point clustering.

## C. 2 Some Brief Reviews

In this section, we give some brief reviews (or more referred details) about some important aspects in our work.
For kernels. We review some important definitions (e.g., positive/negative definite kernels [2]) and theorems (e.g., Theorem 3.2.2 in [2]) about kernels used in our work.

Figure 6: SVM results and time consumption for corresponding kernel matrices in Orbit, MPEG7 datasets w.r.t. different parameters for partition-based tree metric sampling (predefined tree deepest level $H_{\mathcal{T}}$ ).

- Positive definite kernels [2, p.66-67]. A kernel function $k: \mathcal{X} \times \mathcal{X} \rightarrow \mathbb{R}$ is positive definite if $\forall n \in$ $\mathbb{N}^{*}, \forall x_{1}, x_{2}, \ldots, x_{n} \in \mathcal{X}$, we have

$$
\sum_{i, j} c_{i} c_{j} k\left(x_{i}, x_{j}\right) \geq 0, \quad \forall c_{i} \in \mathbb{R}
$$

- Negative definite kernels [2, p.66-67]. A kernel function $k: \mathcal{X} \times \mathcal{X} \rightarrow \mathbb{R}$ is negative definite if $\forall n \geq$ $2, \forall x_{1}, x_{2}, \ldots, x_{n} \in \mathcal{X}$, we have

$$
\sum_{i, j} c_{i} c_{j} k\left(x_{i}, x_{j}\right) \leq 0, \quad \forall c_{i} \in \mathbb{R} \text { s.t. } \sum_{i} c_{i}=0
$$

- Theorem 3.2.2 in [2, p.74] for kernels. If $\kappa$ is a negative definite kernel, then $\forall t>0$, kernel

$$
k_{t}(x, z):=\exp (-t \kappa(x, z))
$$

is positive definite.
For tree metric sampling. The tree metric sampling is described in details in [12][S4]. Le et al. [12] also reviewed the details of the farthest-point clustering in $\S 4.2$ in the supplementary, discussed about thee quantization/clustering sensitivity problems of tree metric sampling in $\S 5$ in the supplementary. Tree metric sampling is also leveraged in other advanced OT problems, e.g., tree-Wasserstein barycenter [10, and a variant of Gromov-Wasserstein (i.e., alignment problems for probability measures having supports in different spaces) (9).

For persistence diagrams and related mathematical definitions in topological data analysis. We refer the reader into [8, §2] for a review about mathematical framework for persistence diagrams (e.g., persistence diagrams, filtrations, persistent homology).

## C. 3 Discussions about Other Relations to Other Work

We note that ultrametric (i.e., non-Archimedean metric, or isosceles metric) and its special case-binary metric are tree metrics [12]. Additionally, a metric for points in a line (e.g., in 1-dimensional projections for supports in SPOT, or SW), or in 1-dimensional manifold (e.g., in 1-dimensional manifold projections for supports in generalized SW [7]) is also a tree metric since we have a corresponding tree as a chain of these points.

We also list some other studies related to OT problem with tree metrics as follows: (i) Kloeckner 66 derived geometric properties of OT space for measures on an ultrametric space, (ii) Sommerfeld and Munk [14] studied statistical inferences for OT on finite spaces including tree metrics.

We note that we consider the discrete measures in our work (e.g., empirical measures). The closed-form formulation of our regularized entropy partial transport (EPT) $\widetilde{E T}_{\lambda}^{\alpha}$ in Equation (8) in the main text is for general discrete nonnegative measures having different masses. To our knowledge, the proposed regularized EPT (i.e., $\widetilde{\mathrm{ET}}_{\lambda}^{\alpha}$ in Equation (8) in the main text) is the first approach that yields a closed-form solution among available variants of unbalanced OT for discrete measures. In the context of unbalanced OT for continuous measures (e.g., probability measures are scaled by positive constants), Janati et al. [5] recently showed that entropic optimal transport for unbalanced Gaussian measures (i.e., Gaussian measures are scaled by different positive constants) has a closed-form solution.
