1. Proof of Theorem 1

Proof. Step 1 – the “if” part. Given a function $\rho(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\}$ for some admissible class $\{\mathbf{V}_k\}$, we show that $\rho(\cdot)$ satisfies all properties required for a CCLF.

Step 1.1 – Complete Classification: If $\mathbf{u} \geq \mathbf{0}$, then by $\mathbf{V}_1 = \mathfrak{R}_m^+$ we have that $\mathbf{v}^\top \mathbf{u} \geq 0$ for all $\mathbf{v} \in \mathbf{V}_1$, which implies that $\sup_{\mathbf{v} \in \mathbf{V}_1} (-\mathbf{v}^\top \mathbf{u}) \leq 0$. Hence $\rho(\mathbf{x}) = 0$. Conversely, if $\mathbf{u} \not\geq \mathbf{0}$, without loss of generality we assume $u_1 < 0$, then we have

$$\sup_{\mathbf{v} \in \mathbf{V}_1} (-\mathbf{v}^\top \mathbf{u}) = \sup_{\mathbf{v} \in \mathfrak{R}_m^+} (-\mathbf{v}^\top \mathbf{u}) \geq -\mathbf{e}_1^\top \mathbf{u} > 0.$$

This, combined with $\mathbf{V}_1 = \text{cl}(\lim_{k \uparrow 1} \mathbf{V}_k)$, leads to that $\exists \delta > 0$ such that

$$\sup_{\mathbf{v} \in \mathbf{V}_{1-\delta}} (-\mathbf{v}^\top \mathbf{u}) > 0,$$

which implies that $\rho(\mathbf{u}) > 0$. This shows that $\rho(\cdot)$ satisfies *complete classification*.

Step 1.2 – Misclassification avoidance: Fix \mathbf{u} such that $\mathbf{u} < \mathbf{0}$. We have $\mathbf{e} \in \mathbf{V}_0$ which implies that

$$\sup_{\mathbf{v} \in \mathbf{V}_0} (-\mathbf{v}^\top \mathbf{u}) \geq (-\mathbf{e}^\top \mathbf{u}) > 0.$$

Hence $\rho(\mathbf{u}) = 1$. Thus, $\rho(\cdot)$ satisfies *misclassification avoidance*.

Step 1.3 – Monotonicity: If $\mathbf{u}_1 \leq \mathbf{u}_2$, then for any $k \in [0, 1]$, since $\mathbf{V}_k \subseteq \mathbf{V}_1 = \mathfrak{R}_m^+$, we have that $-\mathbf{v}^\top \mathbf{u}_1 \geq -\mathbf{v}^\top \mathbf{u}_2$ for any $\mathbf{v} \in \mathbf{V}_k$. Thus,

$$\left\{ \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \mathbf{u}_1) \leq 0 \right\} \implies \left\{ \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \mathbf{u}_2) \leq 0 \right\}.$$

Hence $\rho(\mathbf{u}_1) \geq \rho(\mathbf{u}_2)$. Thus, $\rho(\cdot)$ satisfies *monotonicity*.

Step 1.4 – Order & scale invariance: Order invariance follows directly from the fact that \mathbf{V}_k is order invariant for all k . Scale invariant holds because for $\alpha > 0$ and $k \in [0, 1]$,

$$\left\{ \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0 \right\} \iff \left\{ \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \alpha \mathbf{u}) \leq 0 \right\}.$$

Step 1.5 – Quasi-convexity: To show quasi-convexity, let $c = \max(\rho(\mathbf{u}_1), \rho(\mathbf{u}_2))$ and without loss of generality assume $c < 1$ since otherwise the claim trivially holds. Thus we have that for any $\epsilon > 0$

$$\sup_{\mathbf{v} \in \mathbf{V}_{1-c-\epsilon}} (-\mathbf{v}^\top \mathbf{u}_i) \leq 0, \quad i = 1, 2,$$

which implies that for $\alpha \in [0, 1]$

$$\sup_{\mathbf{v} \in \mathbf{V}_{1-c-\epsilon}} \{-\mathbf{v}^\top [\alpha \mathbf{u}_1 + (1-\alpha) \mathbf{u}_2]\} \leq 0.$$

Thus $1 - \rho(\alpha \mathbf{u}_1 + (1-\alpha) \mathbf{u}_2) \geq 1 - c$ since ϵ can be arbitrarily close to 0. The quasi-convexity holds.

Step 1.6 – Lower semi-continuity: We show that $\rho(\mathbf{u}_*) \leq \liminf_i \rho(\mathbf{u}_i)$ for $\mathbf{u}_i \xrightarrow{i} \mathbf{u}_*$. Let $c > \liminf_i \rho(\mathbf{u}_i)$, then there exists an infinite sub-sequence $\{\mathbf{u}_{i_j}\}$ such that $\rho(\mathbf{u}_{i_j}) < c$. That is

$$-\mathbf{v}^\top \mathbf{u}_{i_j} \leq 0; \quad \forall \mathbf{v} \in \mathbf{V}_{1-c}, \forall j.$$

Note that $\mathbf{u}_{i_j} \rightarrow \mathbf{u}_*$, hence

$$-\mathbf{v}^\top \mathbf{u}_* \leq 0; \quad \forall \mathbf{v} \in \mathbf{V}_{1-c},$$

i.e., $1 - \rho(\mathbf{u}_*) \geq 1 - c$. Since c can be arbitrarily close to $\liminf_i \rho(\mathbf{u}_i)$, the semi-continuity follows.

Step 2 – the “only if” part. Given a function $\rho(\cdot)$ which is a CCLF, we show that it can be represented as

$$\rho(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\},$$

for some admissible class $\{\mathbf{V}_k\}$. This consists of three steps. We first show that $\rho(\cdot)$ can be represented as $\rho(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \overline{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\}$, for some $\{\overline{\mathbf{V}}_k\}$. Here $\{\overline{\mathbf{V}}_k\}$ is not necessarily admissible, but satisfies $\overline{\mathbf{V}}_k \subseteq \overline{\mathbf{V}}_{k'}$ for all $k \leq k'$. We then show that we can replace $\overline{\mathbf{V}}_k$ by a class of closed, convex, order-invariant, cones \mathbf{V}_k . Finally we show that $\{\mathbf{V}_k\}$ is admissible to complete the proof.

Step 2.1. The representability of $\rho(\cdot)$ follows from Theorem 2 of (Brown & Sim, 2009). For completeness we re-state the result as a lemma, and provide the proof below.

Lemma A-1. *Given a CCLF $\rho(\cdot)$, then there exists $\{\overline{\mathbf{V}}_k\}$ that satisfies $\overline{\mathbf{V}}_k \subseteq \overline{\mathbf{V}}_{k'}$ for all $k \leq k'$, such that*

$$\rho(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \overline{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\}.$$

Step 2.2. We construct $\{\mathbf{V}_k\}$ as follows. Let $\hat{\mathbf{V}}_k \triangleq \text{cl}(\text{cc}(\text{or}(\overline{\mathbf{V}}_k)))$. Then we let $\mathbf{V}_k \triangleq \hat{\mathbf{V}}_k$ for $k \in (0, 1)$, and $\mathbf{V}_0 \triangleq \bigcap_{k \in (0, 1)} \hat{\mathbf{V}}_k$, and $\mathbf{V}_1 \triangleq \text{cl}(\bigcup_{k \in (0, 1)} \hat{\mathbf{V}}_k)$. Here $\text{or}(\cdot)$ (respectively $\text{cc}(\cdot)$) is the minimal **order** invariant (respectively, **convex cone**) superset, defined as

$$\text{or}(S) = \{P\mathbf{v} \mid P \in \mathcal{P}_n, \mathbf{v} \in S\}, \quad \text{cc}(S) = \left\{ \sum_{i=1}^k \lambda_i \mathbf{v}_i \mid k \in \mathbb{N}, \mathbf{v}_i \in S, \lambda_i \geq 0 \right\}.$$

Let

$$\rho'(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \hat{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\},$$

and observe that $\overline{\mathbf{V}}_k \subseteq \hat{\mathbf{V}}_k$, hence $\rho(\mathbf{u}) \leq \rho'(\mathbf{u})$. To show that $\rho(\mathbf{u}) \geq \rho'(\mathbf{u})$, it suffices to show that for any k, ϵ and \mathbf{u} , the following holds,

$$\left\{ \sup_{\mathbf{v} \in \overline{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0 \right\} \implies \left\{ \sup_{\mathbf{v} \in \hat{\mathbf{V}}_{k-\epsilon}} (-\mathbf{v}^\top \mathbf{u}) \leq 0 \right\}. \quad (\text{A-1})$$

Note that $\{\sup_{\mathbf{v} \in \overline{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\}$ implies $k \leq 1 - \rho(\mathbf{u})$, and hence by order invariance of $\rho(\cdot)$, we have $k \leq 1 - \rho(P\mathbf{u})$ for all $P \in \mathcal{P}_n$. This means

$$\sup_{\mathbf{v} \in \overline{\mathbf{V}}_{k-\epsilon}} \sup_{P \in \mathcal{P}_n} (-\mathbf{v}^\top P\mathbf{u}) \leq 0,$$

which is equivalent to

$$\sup_{\mathbf{v} \in \text{or}(\overline{\mathbf{V}}_{k-\epsilon})} (-\mathbf{v}^\top \mathbf{u}) \leq 0.$$

By definition of $\text{cc}(\cdot)$, this leads to

$$\sup_{\mathbf{v} \in \text{cc}(\text{or}(\overline{\mathbf{V}}_{k-\epsilon}))} (-\mathbf{v}^\top \mathbf{u}) \leq 0,$$

which further implies, by continuity of $-\mathbf{v}^\top \mathbf{u}$, that

$$\sup_{\mathbf{v} \in \text{cl}(\text{cc}(\text{or}(\overline{\mathbf{V}}_{k-\epsilon})))} (-\mathbf{v}^\top \mathbf{u}) \leq 0.$$

Thus we have $\rho(\mathbf{u}) = \rho'(\mathbf{u})$. Finally note that $\hat{\mathbf{V}}_k \subseteq \hat{\mathbf{V}}_{k'}$ for $k \leq k'$, which leads to the following

$$\begin{aligned} \sup_{\mathbf{v} \in \hat{\mathbf{V}}_0} (-\mathbf{v}^\top \mathbf{u}) &\leq \sup_{\mathbf{v} \in \bigcap_{k \in (0,1)} \hat{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq \sup_{\mathbf{v} \in \hat{\mathbf{V}}_\epsilon} (-\mathbf{v}^\top \mathbf{u}); \\ \sup_{\mathbf{v} \in \hat{\mathbf{V}}_{1-\epsilon}} (-\mathbf{v}^\top \mathbf{u}) &\leq \sup_{\mathbf{v} \in \bigcup_{k \in (0,1)} \hat{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq \sup_{\mathbf{v} \in \hat{\mathbf{V}}_1} (-\mathbf{v}^\top \mathbf{u}). \end{aligned}$$

By definitions of \mathbf{V}_0 and \mathbf{V}_1 , together with the fact (due to continuity)

$$\sup_{\mathbf{v} \in \text{cl}(\bigcup_{k \in (0,1)} \hat{\mathbf{V}}_k)} (-\mathbf{v}^\top \mathbf{u}) = \sup_{\mathbf{v} \in \bigcup_{k \in (0,1)} \hat{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}),$$

we conclude that

$$\rho(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\}.$$

Step 2.3. Now we check that $\{\mathbf{V}_k\}$ is indeed admissible. Property 1-3 are straightforward from the definition of \mathbf{V}_k . To see that \mathbf{V}_0 is closed, recall that the intersection of a class of closed sets is closed.

We next show Property 4: $\mathbf{V}_1 = \mathfrak{R}_+^m$. By definition of \mathbf{V}_1 , we have

$$\lim_{k \rightarrow 1} \sup_{\mathbf{v} \in \mathbf{V}_k} (-\mathbf{v}^\top \mathbf{u}) = \sup_{\mathbf{v} \in \mathbf{V}_1} (-\mathbf{v}^\top \mathbf{u}).$$

Hence $\rho(\mathbf{u}) = 0$ if and only if $\sup_{\mathbf{v} \in \mathbf{V}_1} (-\mathbf{v}^\top \mathbf{u}) \leq 0$. Thus by the property of *complete classification* we have the following

$$\left\{ \sup_{\mathbf{v} \in \mathbf{V}_1} (-\mathbf{v}^\top \mathbf{u}) \leq 0 \right\} \iff \left\{ \mathbf{u} \geq 0 \right\}. \quad (\text{A-2})$$

Denote the dual cone of a cone X by X^* and recall that for any k , \mathbf{V}_k is a closed convex cone, hence we have

$$(\mathbf{V}_1^*)^* = \mathbf{V}_1.$$

The definition of dual cone states that

$$\mathbf{V}_1^* = \{\mathbf{u} \mid \mathbf{u}^\top \mathbf{v} \geq 0; \forall \mathbf{v} \in \mathbf{V}_1\},$$

which combined with Equation (A-2) implies that

$$\mathbf{V}_1^* = \mathfrak{R}_+^m.$$

Since \mathfrak{R}_+^m is self-dual, we have

$$\mathbf{V}_1 = \mathfrak{R}_+^m.$$

We now turn to Property 5. Fix $k > 0$. Consider $\mathbf{u} = -\mathbf{e}$. By misclassification avoidance, $\rho(\mathbf{u}^*) = 1$, which means there exists $\mathbf{v}^* \in \mathbf{V}_k$ such that $\mathbf{v}^{*\top} \mathbf{u} < 0$, i.e., $\sum_{i=1}^m v_i^* > 0$. Define a permutation matrix $P \in \mathcal{P}_m$:

$$P = \begin{bmatrix} 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \cdot & \cdot & \cdot & \cdots & \cdot \\ 0 & 0 & 0 & \cdots & 1 \\ 1 & 0 & 0 & \cdots & 0 \end{bmatrix}.$$

Thus, by order invariance of \mathbf{V}_k , $P^t \mathbf{v}^* \in \mathbf{V}_k$ for $t = 0, \dots, m-1$. By convexity, this implies $\frac{1}{m} \sum_{t=0}^{m-1} P^t \mathbf{v}^* \in \mathbf{V}_k$. Note that $\frac{1}{m} \sum_{t=0}^{m-1} P^t \mathbf{v}^* = [\sum_{i=1}^m v_i^*] \mathbf{e} / m$, thus

$$\frac{\sum_{i=1}^m v_i^*}{m} \mathbf{e} \in \mathbf{V}_k.$$

Since $\sum_{i=1}^m v_i^* > 0$ and \mathbf{V}_k is a cone, we have $\lambda \mathbf{e} \in \mathbf{V}_k$ for all $\lambda \geq 0$ and $k > 0$. By definition of \mathbf{V}_0 , this implies $\lambda \mathbf{e} \in \mathbf{V}_0$. \square

The rest of this appendix provides a proof to Lemma A-1.

Proof. We recall the following results adapted from (Brown & Sim, 2009).

Definition A-1. Let \mathcal{U} be the set of random variables on the probability space $(\Omega, \mathcal{F}, \mathbb{P})$. A function $\bar{\rho}(\cdot) : \mathcal{U} \rightarrow [0, 1]$ is a collective satisfying measure if the following holds for all $U, U' \in \mathcal{U}$.

1. If $U \geq 0$, then $\bar{\rho}(U) = 1$;
2. If $U < 0$, then $\bar{\rho}(U) = 0$;
3. If $U \geq U'$ then $\bar{\rho}(U) \geq \bar{\rho}(U')$;
4. $\lim_{\alpha \geq 0} \bar{\rho}(U + \alpha) = \bar{\rho}(U)$;
5. If $\lambda \in [0, 1]$, then $\bar{\rho}(\lambda U + (1 - \lambda)U') \geq \min(\bar{\rho}(U), \bar{\rho}(U'))$;
6. If $k > 0$, then $\bar{\rho}(kU) = \bar{\rho}(U)$.

Theorem A-1. Any collective satisfying measure $\bar{\rho}(\cdot)$ can be represented as

$$\bar{\rho}(U) = \sup\{k \in [0, 1] \mid \sup_{Q \in \mathcal{Q}_k} \mathbb{E}_Q(-U) \leq 0\},$$

for a class of sets of probability measures \mathcal{Q}_k satisfying $\mathcal{Q}_k \subseteq \mathcal{Q}_{k'}$ for $k \leq k'$.

Given this general result, we focus on a special case where $\Omega = \{1, 2, \dots, m\}$. Note that in this case each random variable $U : \Omega \mapsto \mathfrak{R}$ can be represented as a vector $\mathbf{u} \in \mathfrak{R}^m$ where $u_i = U(i)$. Given a CCLF $\rho(\cdot) : \mathfrak{R}^m \rightarrow \mathfrak{R}$, we define $\bar{\rho} : \mathcal{U} \mapsto \mathfrak{R}$ as following

$$\bar{\rho}(U) = 1 - \rho(\mathbf{u}); \quad \text{where } u_i = U(i), \quad i = 1, \dots, m.$$

It is straightforward to check that $\bar{\rho}(\cdot)$ is a collective satisfying measure. Thus, Theorem A-1 states there exists a class of sets of probability measure \mathcal{Q}_k such that

$$1 - \rho(\mathbf{u}) = \bar{\rho}(U) = \sup\{k \in [0, 1] \mid \sup_{Q \in \mathcal{Q}_k} \mathbb{E}_Q(-U) \leq 0\}.$$

Note that any probability measure Q on $\Omega = \{1, \dots, m\}$ can be represented by a vector $\mathbf{v} \in \mathfrak{R}^m$ such that $v_i = Q(i)$. Thus $\mathbb{E}_Q(-X) = -\mathbf{v}^\top \mathbf{x}$ where \mathbf{v} and \mathbf{u} are the vector form for Q and U respectively. Hence we have there exists $\bar{\mathbf{V}}_k$ such that

$$\rho(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \bar{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\}.$$

Note that for $k \leq k'$, $\bar{\mathbf{V}}_k \subseteq \bar{\mathbf{V}}_{k'}$ since $\mathcal{Q}_k \subseteq \mathcal{Q}_{k'}$. This concludes the proof of Lemma A-1. □

2. Proof of Theorem 2

Proof. **Claim 1:** We check that all conditions of Definition 1 are satisfied by $\bar{\rho}(\cdot)$. The only condition needs a proof is the semi-continuity. Consider a sequence $\mathbf{u}^j \rightarrow \mathbf{u}^0$, and let $t^0 = \max\{t : \sum_{i=1}^t u_i^0 < 0\}$. Without loss of generality we let $u_1^0 \leq u_2^0 \leq \dots \leq u_m^0$. Thus we have that $\sum_{i=1}^{t^0} u_i^0 < 0$. This implies that $\limsup_j \sum_{i=1}^{t^0} u_i^j < 0$, which further leads to $\liminf_j (\max\{t : \sum_{i=1}^t u_i^j < 0\}) \geq t^0$. Hence $\liminf_j \bar{\rho}(\mathbf{u}^j) \geq \bar{\rho}(\mathbf{u}^0)$, which established the semi-continuity. Thus, we conclude that $\bar{\rho}(\cdot)$ is a CCLF. Further, observe that $\max\{t : \sum_{i=1}^t u_i < 0\} \geq \sum_{i=1}^m \mathbf{1}(u_i < 0)$, which established the first claim.

Claim 2: It is straightforward to check that $\bar{\mathbf{V}}_k$ satisfies all conditions of Definition 2, and hence is an admissible set. Thus, we proceed to show that $\bar{\mathbf{V}}_k$ is an admissible set corresponding to $\bar{\rho}(\cdot)$, i.e., to show

$$\bar{\rho}(\mathbf{u}) = 1 - \sup\{k \in [0, 1] \mid \sup_{\mathbf{v} \in \bar{\mathbf{V}}_k} (-\mathbf{v}^\top \mathbf{u}) \leq 0\}.$$

Fix a $\mathbf{u} \in \mathfrak{R}^m$. If $\mathbf{u} \geq 0$, then we have $\bar{\rho}(\mathbf{u}) = 0$, as well as $\sup_{\mathbf{v} \in \bar{\mathbf{V}}_1} (-\mathbf{v}^\top \mathbf{u}) \leq 0$, and hence the equivalence holds trivially. Thus we assume $\mathbf{u} \not\geq 0$, and let $t^0 = \max\{t : \sum_{i=1}^t u_i < 0\}$. By definition we have

$$\bar{\mathbf{V}}_{1-t^0/m} = \text{conv} \{ \lambda \mathbf{e}_{N'} \mid \lambda > 0, |N'| = t^0 + 1 \}.$$

Note that by definition of t^0

$$\min_{|N'|=t^0+1} \sum_{i \in N'} u_i \geq 0,$$

which implies that

$$\sup_{\mathbf{v} \in \{\mathbf{e}_{N'} \mid |N'|=t^0+1\}} (-\mathbf{v}^\top \mathbf{u}) \leq 0.$$

This leads to

$$\sup_{\mathbf{v} \in \bar{\mathbf{V}}_{1-t^0/m}} (-\mathbf{v}^\top \mathbf{u}) \leq 0. \tag{A-3}$$

On the other hand for arbitrarily small $\epsilon > 0$, by definition

$$\bar{\mathbf{V}}_{1-t^0/m+\epsilon} = \text{conv} \{ \lambda \mathbf{e}_N \mid \lambda > 0, |N| = t^0 \}.$$

Because $\min_{N:|N|=t^0} \sum_{i \in N} u_i < 0$, we have

$$\sup_{\mathbf{v} \in \bar{\mathbf{V}}_{1-t^0/m+\epsilon}} (-\mathbf{v}^\top \mathbf{u}) > 0.$$

Combining with Equation (A-3) we established the second claim.

Claim 3: Let $\rho'(\cdot)$ be a CCLF satisfying that $\rho'(\mathbf{u}) \geq \varrho(\mathbf{u})$ for all $\mathbf{u} \in \mathfrak{R}^m$, and let $\{\mathbf{V}'_k\}$ be its corresponding admissible set. Thus, it suffices to show that $\bar{\mathbf{V}}_k \subseteq \mathbf{V}'_k$ for all k . This holds trivially for $k = 0$, since $\rho'(\mathbf{u}) = 1$ for all $\mathbf{u} < 0$ implies that $\lambda \mathbf{e} \in \mathbf{V}'_0$. When $k > 0$, let $s/m < k \leq (s+1)/m$ for some integer s . Then, since \mathbf{V}'_k is an order-invariant convex cone, it suffices to show that $\mathbf{e}_{[1:m-s]} \in \mathbf{V}'_k$ to establish the third claim. Consider $\mathbf{u}^* \triangleq -\mathbf{e}_{[1:m-s]}$. Then, by $\rho'(\mathbf{u}^*) \geq \sum_i \mathbf{1}(u_i^* < 0)/m = s/m < k$, we have

$$\begin{aligned} & \sup_{\mathbf{v} \in \mathbf{V}'_k} (-\mathbf{v}^\top \mathbf{u}^*) > 0 \\ \implies & \exists \mathbf{v}^* \in \mathbf{V}'_k : \sum_{i=1}^{m-s} v_i^* > 0. \end{aligned}$$

Define a permutation matrix P :

$$P = \begin{bmatrix} P_1 & 0_{(m-s) \times s} \\ 0_{(m-s) \times s} & 0_{s \times s} \end{bmatrix},$$

where P_1 is a $(m-s) \times (m-s)$ matrix:

$$P_1 = \begin{bmatrix} 0 & 1 & 0 & \cdots & 0 \\ 0 & 0 & 1 & \cdots & 0 \\ \cdot & \cdot & \cdot & \cdots & \cdot \\ 0 & 0 & 0 & \cdots & 1 \\ 1 & 0 & 0 & \cdots & 0 \end{bmatrix}.$$

Thus, by order invariance of \mathbf{V}'_k , $P^t \mathbf{v}^* \in \mathbf{V}'_k$ for $t = 0, \dots, m-s-1$. By convexity, this implies $\frac{1}{m-s} \sum_{t=0}^{m-s-1} P^t \mathbf{v}^* \in \mathbf{V}'_k$. Note that $\frac{1}{m-s} \sum_{t=0}^{m-s-1} P^t \mathbf{v}^* = [\sum_{i \in [1:m-s]} v_i^*] \mathbf{e}_{[1:m-s]} / (m-s)$, thus

$$\frac{\sum_{i=1}^{m-s} v_i^*}{m-s} \mathbf{e}_{[1:m-s]} \in \mathbf{V}'_k.$$

Since $\frac{\sum_{i=1}^{m-s} v_i^*}{m-s}$ is positive, and \mathbf{V}'_k is a cone, we have $\mathbf{e}_{[1:m-s]} \in \mathbf{V}'_k$, which completes the proof. \square

3. Proof of Theorem 3

Proof. We prove the theorem by constructing such a function $\rho(\cdot)$. To do this, first consider $\check{\rho} : \mathcal{R}^m \mapsto [0, 1]$ defined as

$$\check{\rho}(u) = \min_{\gamma > 0} \hat{\rho}(u/\gamma).$$

Then it is easy to check that $\check{\rho}(\cdot)$ satisfies complete classification, misclassification avoidance, monotonicity, order invariance, and scale invariance. To see that $\check{\rho}(u) \geq \varrho(u)$, note that if u has t negative coefficients, then for any $\gamma > 0$, u/γ also has t negative coefficients, which means

$$\hat{\rho}(u/\gamma) \geq t/m.$$

Taking minimization over γ , we have $\check{\rho}(u) \geq \varrho(u)$ holds. Finally, we show quasi-convexity of $\check{\rho}(\cdot)$. Fix u_1, u_2 , and $\alpha \in [0, 1]$, let γ_1, γ_2 be ϵ -optimal, i.e.,

$$\hat{\rho}(u_i/\gamma_i) \leq \check{\rho}(u_i) + \epsilon, \quad i = 1, 2.$$

Since $\hat{\rho}$ is quasi-convex, we have

$$\begin{aligned} \hat{\rho}\left(\frac{\alpha u_1 + (1-\alpha)u_2}{\alpha\gamma_1 + (1-\alpha)\gamma_2}\right) &= \hat{\rho}\left(\frac{\alpha\gamma_1}{\alpha\gamma_1 + (1-\alpha)\gamma_2} \cdot \frac{u_1}{\gamma_1} + \frac{(1-\alpha)\gamma_2}{\alpha\gamma_1 + (1-\alpha)\gamma_2} \cdot \frac{u_2}{\gamma_2}\right) \\ &\leq \max\left\{\hat{\rho}\left(\frac{u_1}{\gamma_1}\right), \hat{\rho}\left(\frac{u_2}{\gamma_2}\right)\right\} \end{aligned}$$

which implies

$$\check{\rho}(\alpha u_1 + (1-\alpha)u_2) \leq \hat{\rho}\left(\frac{\alpha u_1 + (1-\alpha)u_2}{\alpha\gamma_1 + (1-\alpha)\gamma_2}\right) \leq \max\left\{\hat{\rho}\left(\frac{u_1}{\gamma_1}\right), \hat{\rho}\left(\frac{u_2}{\gamma_2}\right)\right\} \leq \max\{\check{\rho}(u_1), \check{\rho}(u_2)\} + \epsilon.$$

Hence $\check{\rho}(\cdot)$ is quasi-convex. Note that the only property that is not satisfied is the semi-continuity. To handle this, define $\rho : \mathcal{R}^m \mapsto [0, 1]$ as

$$\rho(u) = \lim_{\epsilon \downarrow 0} \check{\rho}(u + \epsilon e)$$

Because of monotonicity of $\check{\rho}(\cdot)$, $\rho(\cdot)$ is well-defined. In addition, it can be shown that $\rho(\cdot)$ is lower-semicontinuous. Complete classification, misclassification avoidance, monotonicity, order invariance, scale invariance, and quasi-convexity all follows easily from the fact that same property holds for $\check{\rho}(\cdot)$. Thus, $\rho(\cdot)$ is a CCLF w.r.t. m . Next, we show that

$$\hat{\rho}(u) \geq \rho(u) \geq \varrho(u).$$

The first inequality holds due to $\hat{\rho}(u) \geq \check{\rho}(u) \geq \check{\rho}(u + \epsilon e)$. The second inequality holds because for any u , there exists $\epsilon > 0$ small enough such that $\varrho(u + \epsilon e) = \varrho(u)$. Thus, taking limit over $\check{\rho}(u + \epsilon e) \geq \varrho(u + \epsilon e)$ establishes the second inequality. Recall that $\bar{\rho}(u)$ is the minimal CCLF, we establish the lemma by

$$\varrho(u) \leq \bar{\rho}(u) \leq \rho(u).$$

□

4. Proof of Theorem 5

Proof. To prove Theorem 5, we start with establishing the following lemma. Observe that $\bar{\rho}(\mathbf{u})$ only takes value in $\{0, 1/m, 2/m, \dots, 1\}$.

Lemma A-2. *The level set of Problem (4), i.e., $\mathcal{U}_i \triangleq \{(\mathbf{u}, \mathbf{w}) | \bar{\rho}(\mathbf{u}) \leq 1 - i/m; f_j(\mathbf{u}, \mathbf{w}) \leq 0, \forall j\}$ for $i = 1, \dots, m$, equals the following*

$$\{(\mathbf{u}, \mathbf{w}) | \exists d : \sum_{i=1}^m [d - u_i]^+ \leq (m - i + 1)d; f_j(\mathbf{u}, \mathbf{w}) \leq 0, \forall j.\}$$

Proof. From Property 2 of Theorem 2, we have that \mathcal{U}_i equals to the feasible set of the following program

$$\begin{aligned} \sup_{\mathbf{v} \in \bar{\mathbf{V}}_{i/m}} \quad & (-\mathbf{v}^\top \mathbf{u}) \leq 0; \\ f_j(\mathbf{u}, \mathbf{w}) \leq 0; \quad & j = 1, \dots, n. \end{aligned}$$

Recall that $\bar{\mathbf{V}}_{i/m} = \text{conv} \{ \lambda \mathbf{e}_N \mid \lambda > 0, |\mathcal{N}| = m - i + 1 \}$ we have that $\sup_{\mathbf{v} \in \bar{\mathbf{V}}_{i/m}} (-\mathbf{v}^\top \mathbf{u}) \leq 0$ is equivalent to

$$\inf_{\mathbf{v}: \mathbf{0} \leq \mathbf{v} \leq \mathbf{e}, \mathbf{e}^\top \mathbf{v} = m - i + 1} \mathbf{v}^\top \mathbf{u} \geq 0,$$

which left-hand-side by duality theorem is equivalent to the following optimization problem on (\mathbf{c}, d)

$$\begin{aligned} \text{Maximize:} \quad & \sum_{i=1}^m c_i + (m - i + 1)d \\ \text{Subject to:} \quad & c_i + d \leq u_i \\ & c_i \leq 0. \end{aligned}$$

Thus we have $\mathbf{u} \in \mathcal{U}_i$ if and only if there exists \mathbf{c} , d , and \mathbf{w} such that

$$\begin{aligned} \mathbf{e}^\top \mathbf{c} + (m - i + 1)d &\geq 0; \\ \mathbf{c} + d\mathbf{e} &\leq \mathbf{u}; \\ \mathbf{c} &\leq \mathbf{0}; \\ f_j(\mathbf{u}, \mathbf{w}) &\leq 0; \quad j = 1, \dots, n. \end{aligned}$$

Note that this can be further simplified, since optimal $c_i = -[d - u_i]^+$, as

$$\begin{aligned} \sum_{i=1}^m [d - u_i]^+ &\leq (m - i + 1)d \\ f_j(\mathbf{u}, \mathbf{w}) &\leq 0; \quad j = 1, \dots, n. \end{aligned} \tag{A-4}$$

This establishes the lemma. □

Now we turn to prove Theorem 5. Recall the assumption that there are no \mathbf{u}, \mathbf{w} such that $\mathbf{u} \geq \mathbf{0}$, and $f_j(\mathbf{u}, \mathbf{w}) \leq 0$ for all j . Thus any feasible solution to (A-4) must have $d > 0$. Hence the feasible set to Problem (A-4) is equivalent to that of

$$\begin{aligned} \sum_{i=1}^m [1 - u_i/d]^+ &\leq (m - i + 1) \\ f_j(\mathbf{u}, \mathbf{w}) &\leq 0; \quad j = 1, \dots, m. \end{aligned}$$

Thus, finding the optimal solution to Problem (4) is equivalent to solve the following

$$\begin{aligned} \text{Minimize:} \quad & \sum_{i=1}^m [1 - u_i/d]^+ \\ \text{Subject to:} \quad & f_j(\mathbf{u}, \mathbf{w}) \leq 0; \quad j = 1, \dots, n; \\ & d > 0. \end{aligned} \tag{A-5}$$

By a change of variable where we let $h = 1/d$, $\mathbf{s} = \mathbf{u}h$, $\mathbf{t} = \mathbf{w}h$, this is equivalent to

$$\begin{aligned} \text{Minimize:} \quad & \sum_{i=1}^m [1 - s_i]^+ \\ \text{Subject to:} \quad & h f_j(\mathbf{s}/h, \mathbf{t}/h) \leq 0; \quad j = 1, \dots, n; \\ & h > 0. \end{aligned}$$

Hence Theorem 5 is established. □
